Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: February 16, 2006

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

6252. How long will an Atari ROM last?

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-02 05:36:05 UTC
From: Mike Tennyson <miketennyson@bellsouth.net>
Message-ID: <emJXf.5415$Q8.4145@bignews4.bellsouth.net>
Source record: 7259

I am an Atari cart collector and I was wondering if thre is a lifespan to an Atari cart? It has been over 20 years on most of the carts and they all still work. Anyone know if the memory eventually fades?

Mike Tennyson

6253. Re: 130XE released but still 1050 ???

Let's just say never. <g> Same here with me. All my carts work fine. I will
say that some of my 8-bit disks do not work, but about 95% do.

There exists an extension for the 1050 which does this trick: the
1050 Turbo module by Bernhard Engl (released in 1986). It's just a
replacement for the 1050 ROM and consists only of a ROM chip plus
some logic ICs to do bankswitching.

I've always wondered how this really worked (yes, you need a 256 byte
buffer if you want to use 256 byte sectors). Some time ago I talked
to Bernhard Engl and he explained the trick: If you can live with
a subroutine level of 1 you don't really need a stack. Instead he
just used the stack-pointer as kind of a function index.

The software in the 1050 (turbo) is quite straight forward and using
only one subroutine level is sufficient. Consider what happens eg
when reading a sector: first the 1050 receives the command frame,
then it has to read either 128 or 256 bytes from disk, then it
transmits the data frame (either 128 or 256 data bytes) to the
computer.

After command frame reception, the software knows if the sector
is either 128 or 256 bytes. So it sets up the stack pointer register
to, lets say, 1 for "send 128 bytes" and 2 for "send 256 bytes"
and then jumps to the read-disk-sector subroutine. At the end
of the routine, it checks the S register and then jumps to
the right "send bytes" routine.

The fine thing about the 1050 Turbo was that it was a lot cheaper
than all the other floppy-speeders (like happy/speedy/...). It cost
only 99 DEM and with 49 DEM more you could add a printer interface
(this interface was connected directly to the module inside the
1050). And, the 1050 Turbo came with one of the most sophisticated
backup tools. Very fine thing and it was also very popular here
in Europe (especially Germany and Austria).

so long,

Hias

Real roms should last longer then you and your grandkids.. Unless they
are physically abused. (breakage, rust, etc)

Eproms.. They wont last forever, even if kept properly.

6258. Modern SCSI drives and Black Box

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-02 16:28:42 UTC
From: Larry <LLppwhite@earthlink.net>
Message-ID: <1143995322.372419.289510@z34g2000cwc.googlegroups.com>
Source record: 7265

What are some kinds of SCSI hard dries folks are using with their Black
Box setups?

I have not been able to get anything larger than apx. 230 MB embedded
"narrow" 50-pin (mine are SCSI II -- I think) to work with mine.

Is anyone using something larger? What brand/model? Any brands/types
to avoid? My current drive is getting loud, so I suspect it is going
to fail soon, and I'd like to replace it before rather than after!
Thanks,
Larry

Should have added this to the last post. Formatting seems to be an
issue with modern drives using the BB formatter. Has anyone been able
to format a drive in Windows or MS-Dos and then set up and use that
drive with the BB? That might be a good work-around for the formatting
issues. Note that I'm referring to a low-level format only.
Thanks,
Larry

6260. UK - upgrading XE VGS, want to have a nice 8-bit setup again

I want to make a nice 8-bit setup to mess with at some point. I've got
an XE:VGS lurking, I'd like to upgrade the RAM if possible, and
obviously find disk drives and the like.

I can always run an emulator, but I like having functional hardware.

6261. DGS Atari 8-bit CD-ROM $5 special (until 7 April 2006)

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-02 18:33:07 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1144002783.65223.0@doris.uk.clara.net>
Source record: 7268

Hello All,

This week (until 7 April 2006) I will be offering the DGS Atari 8-bit CD-ROM (commercial and PD combo) for the special price of $5 (2pounds for UK buyers), which is a $3.50 saving on the usual price. This price includes SURFACE MAIL shipping to any country (2nd class post for UK buyers). This offer is for those of you who want to save some money, but don't mind waiting as surface mail can take 60+ days!

If you don't already know, the CD contains most of the DGS commercial Atari 8-bit products and the full DGS PD library (191 double sided disks). The commercial products include the PPP products QUICK programming language, SAM 80-col GUI (no extra hardware required), and games, along with the Digi-Studio digitized music package, all 26 issues of the DGS newsletter, and more. All products are in both DCM and ATR format, and have PDF versions of the manuals. A copy of the video we shot at the 1996 AMS show is also on the CD in MPEG-1 format. Full details with descriptions and screen shots are available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8-su.htm

Payment is by PayPal only, and there are payment buttons on the page. If you prefer, you can PayPal the money directly to me if you don't like using direct payment links.

There's plenty of background info on DGS on the main part of the website.

Dean Garraghty

I have used optical scsi, any older Apple external 50pin scsi, conner,
seagate, the list goes on, but to get a good format and partitions all the
hard drive geometry needs to be known. And proper termination with lun pins
properly selected, and a short scsi cable. I have not had real good luck
with any of the newest 60 and 80 pin drives needing an adapter, nor any
drive that can be selected above 7 drives.. SyQuest drives are my favorite
with optical removable disks.

I don't think that I have every had to low level format a drive. I just
setup partitions and then with MyDos I -init after setting the O parameter
for config disk....sector size..etc.. And with SpartaDOS I use FMTDIR.COM
to do the init then copy xxxx.dos to drive(partition) then Type BOOT
xxxx.dos reboot and it is over.. Low leveling a drive can lose important
drive information that only the drive looks for..

Infocom once claimed disk space as the reason they stopped supporting certain formats. At the time, as I recall, rampant piracy was the reason given in the magazines I read. No one thought they could make a profit with 8-bit Atari games. IIRC, Datasoft/Intellicreations were the last major label to support the 8-bit Atari although SSI lasted until 1988 or so. The late 80s were also the time when C64 production was taking off. Remember it was the best-selling single model of computer of all time. (The bugs that "revision B" had didn't help matters. When I bought a 1027 printer for my 800XL and it didn't work...I returned it to the store and got a Commodore 64. I didn't find out until years after that the printer needed like 10-15 minutes to warm up due to bugs. When I bought the printer, the salesperson made a point of commenting it could be returned. Obviously, I wasn't the only one who had a problem with it.) I recall lots of C64 software was cheaper than, say, Apple II titles by $5 or so because more units were expected to sell.

Also, since conversions were often done "out of house," there was the matter of finding people willing to convert something when they might have felt their time would be more profitably used on another platform.

Of course, replacing an Apple II's processor with a faster processor
won't do anything to accelerate it.

The problem with using a 65C02 in an Apple][+ has to do with setup and
hold time differences, and some liberties taken in the Apple II design.

Good thing is: this already happened :-)

Bernhard Engl gave permission to ABBUC to release all the documentation
to his products and also to build new versions of the 1050 Turbo
and the Turbo Freezer. I built a highly improved, new version of
the TurboFreezer which is also available from ABBUC. The documentation
on my webpage isn't complete yet but I'm working on it.

You can find the documentation to the original products in the
ABBUC infothek (most docs are in german, but this shouldn't be
a too big problem for you, I guess :-)

http://www.strotmann.de/twiki/bin/view/Infothek/1050Turbo

> -Larry

Hi, Larry. It is an 800 replacement OS, but it was meant for XL/XE machines so the rom file must be built in the same order to match the way the standard XL OS was put together as a 16k rom. A flat out copy from $C000 thru $FFFF wouldn't include the self test area code (and there is some in XL Boss) but would include the hardware registers which are not wanted in a rom file anyway. On the 800, $D800 starts with the math pack code so at first glance one could just (K) Save memory as a file, $D800 thru $FFFF in DOS 2.0 no less, strip the six byte Atari file header, and have the complete 800 OS - the size is just right for that range at 10k exactly. The ATARIOSB.ROM file as used in emulators for the 800 OS does start with the math pack and is exactly 10k in size as well, and that is the advertised size of the 800 OS. BUT then you can read page 107 of Mapping the Atari where they say that there is some code at $C000 thru $CFFF in the 800 and I have seen it, but just how it got there from only a 10k rom is beyond my full understanding at the moment.

I have not been contacted by RetroJess who seems to have left the thread, but by another who does not post in newsgroups and left XL Boss V1.0 and XL/XE BossII V2.0 images for me to spread around. Send a requesting email to lee_454*AT*yahoo.com with BOSS as the subject and I'll attach them to a return email or other email address specified in the request email, you too Ron and/or anybody else. Anybody care to host these? Please? Yahoo email is no fun at 14.4 dial up.

Was there a Boss OS for the 800? Seems like there might well have been, but I missed out on the early Atari days and don't know much

about what was ever offered for the 800. Anybody? The saga continues...?

I also have found a film canister among a rather large batch of 800 stuff that has omnimon 4k written on the side of it, inside is a 2732 eprom with omni written on it, and from the code yet further inside, it appears to be OmnimonA1 from 1983 for the 800? I don't know if there is supposed to also be an A2 or B1 rom for that matter, but if you want an image file of this one, just ask for it too. Again, anybody.

Lee

6274. IDE Laptop Drive with Black Box!

Newsgroup: comp.sys.atari.8bit

In view of my difficulties in trying to find a modern SCSI drive that worked properly with my BB, I decided to take another path -- and it paid off! I'm now using a Toshiba MK2110MAT 2-1/2" laptop drive with my Black Box. But that's IDE! Yes, and to make it work I'm using an Acard AEC7720U (narrow scsi) HD adapter that translates the IDE signals into SCSI-speak. I've tried several IDE drives so far, and they all have setup easily and worked well. I'll write more after I've done more experimentation -- I see no reason why other IDE devices should not work as easily. But note this is IDE not ATAPI. I believe they have another adapter for ATAPI. My noisy (death-rattles?) SCSI HD is now replaced by a "barely whispering" laptop drive!

I have done exactly that on my SyQuest 200 meg SCSI 2 drives with
removable cartridges. I used an Adaptec AHA-1520B ISA card in this
older PC clone with Bart's SCSI tool (floppy boot) to LL format and
then test/zero wipe the cartridges. I believe but am not sure that his
program also gives explanatory 'sense' error texts but the program
first has to mount the drive before you can get to that info section.
Neat deal is the sector copier that allows for full cartridge cloning
in 6 minutes.
Bart's ScsiTool
http://www.nu2.nu/scsitool/

IIRC I never did get ANY drive LL formatted using the BlackBox tool for
that purpose. My old SCSI 1 system would 'hold' the 8bit's boot until
the hard drive was up to speed and mounted and then go ahead and allow
the 8bit to boot. These SCSI 2 drives won't, if you try to boot the
8bit while the drive is still winding up you won't boot from the hard
drive. I suspect that SCSI 2 is probably the highest SCSI version that
will work at all with the BlackBox?

You should try to do that with the hardware of this era. They'll have
a good laugh when somebody walks in to the store and says "I bought
this new printer for my pc and it doesn't work with windows 95. I want
my money back" :)

Hi Thomas-

> I wonder if this same approach would work with an MIO? <

Unfortunately, probably not -- the reason is the 256-byte sectors needed for the MIO. But I did contact Seagate perhaps a year ago, and their tech told me he believed that virtually any SCSI drive can be made to read 256-byte sectors if you are willing to go at the drive with the proper software. Bart's SCSI Tool (mentioned here in another recent post) may allow you to do that. I've never used it, but have seen a number of posts that say it really works well. So that potentially means that there are a whole lot of SCSI drives that can be used with the MIO, and not just the scarce-as-hen's-teeth MFM drives and a very few Seagate 225N's that would format out with 256-byte sectors.

Maybe sometime I'll get out an MIO and have a go at it with BST -- then again, that sounds like a lot of work considering I still have a couple good MFM drives...

Hi Roy and Lee-

Thanks to you both for your helpful replies. As you can see from my more recent post, I got the system going with an IDE/SCSI bridge card.

I have formatted older SCSI I and II drives with the BB formatter, but just had no luck with more recent drives. As a matter of fact, most of them would not even accept the drive configuration data to sector zero. I've never tried a wide SCSI drive, but I'm pretty sure that you would need a wide to narrow converter with high-byte termination. That causes the controller to see only 50 pins -- just like it's a narrow SCSI device. I was not aware that some SCSI drives are low-level "pre-formatted" just like IDE drives. That's good info to know.

I also have not used Bart's SCSI Tool, although I'm familiar with it -- that might just be the key as goes SCSI drives and the BB. But since IDE gives one so many more options, I suspect my BB has seen its last (real) SCSI drive. Oops, not quite true -- I still use a SCSI Zip drive for backups. And in truth, the ZIP drive is almost as fast as a regular HD when used with the BB.

Anyway, this has been rewarding, especially to be able to use an extremely quiet, space-efficient, +5-volt only HD with the BB.

Cheers,
Larry

Based on the articles in ANALOG and Antic:

http://www.cyberroach.com/analog/an25/xlboss.htm

http://www.atarimagazines.com/v3n10/productreviews.html

I get the strong impression that there was no BOSS for the 400/800. The way the reviewers describe it (the ANALOG review is far more informative than the Antic review), one of the main points of the XL BOSS seems to have been to restore compatability with the 400/800 OS.

6286. Final Frontier 2 (long post)

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-05 16:17:53 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.04.05.16.17.53.286687@charter.net>
Source record: 7293

Folks, we're gearing up for another round of Final Frontier 2 here at the DarkForce! BBS. We're looking to recruit more players. If you've never played FF2 before, you're in for a real treat. I'm posting the Intro here, so you can get a "feel" about what the game is like. Please be sure and read the Documentation when you play!

Final Frontier II Introduction:

As I looked up from my comm display at the alien with discolored black and green splotches all over his face, I felt a wave of pity run deep within my bowels. The tears ran down his cheeks as he sat, shaking, in the plaid Naugahyde seat beside me, slowly telling me his story.

"It was HORRIBLE," sobbed the broken humanoid." I knew I had the intestinal fortitude to handle it, being descended from Terran kings, but the atrocities committed in the FINAL FRONTIER war were just too hard to bear; especially those in THE DEAD GODS sector...that rebel DARKCHYLD's home turf!!"

'Kings? What?' I thought. I put the comm on auto and leaned back into my chair, fixing my full attention on his story.

"It all started in the general assembly right before the war," he said. "The Satharians were miffed because of Ted Turner XXXIV and his holographic

imaging colorization of something called 'I Love Lucy.' I think it had something to do with a red-haired puritan axe-murder. Anyways, distribution in the outer-rim was poor, and the Saths were literally shedding skin over it."

He leaned back in the chair with a gracefulness I had not seen in ages, picking up his tea spoon and twirling it with exaggerated movements. Anything to break

"It all seemed like a small interplanetary riot, you know, the kind that never gets any press anymore. Then that goody-goody MORDEN stepped in," He quick snorted and wiggled his nose contemptuously. "He promised the lizards he would acquire the rights to the shows and air them nationally. But instead he packed up the Saths' national treasury, stole the prime ministers wife, knocked off two holoburger stands, and, dear God, slandered the good name of the acquitted sports hero Orangutan Jumper Sampson..."

I shook my head, remembering it well. "And that's when the proverbial guano hit the gliding rotisserie blades..." I said.

"You guessed it," he continued. "Everyone went berserk, buying ships, weapons and other stuff. Interplanetary systems dissolved, governments collapsed, and

all-out chaos ensued. And that was just from the media coverage alone!" "People started colonizing planets everywhere, trying to get a foothold of power. Dr. Scholl became a billionaire! But the thing about it was nothing was

sacred," he said. "People were invading people, taking planets, and wasting each other just for kicks. It got so you had to hide in a sun's corona just to get some sleep."

"But that's when all the new developed technology started coming about," I interjected. "You know, booby-trapping derelict ships, laying mines, massive production of defense installations, trade routes and other stuff."

"Not to mention the illicit beaming of 'Sweatin' to the Oldies' onto command bridges playback consoles," he said.

I shuddered. Truly a fate worse than death...

"And that wasn't even the worst of it," the curly-haired alien said. "What about those distinguished few, ROGUE, SYSOP, MORPH and others; the real nuts! They sneaked around with weird aliases and thought no one would notice...."

"Yeah, some real unholy alliances came about because of this war," I said as I read my tactical display, looking for SPACE PIRATES. " And with the new increased galactic size, there's going to be a LOT more space to hide in.

Suddenly, the ship rocked with an explosion! Red alerts resounded across my bridge. "And shut that blasted noise off!" came a command. From the back of my mind twas some weird English-accented old man's voice. My alien copilot looked at me as if he had read my mind.

"JEAN-LUC!" we said in unison. The alien started to reach under the dash for the General Foods International Coffees, when another burst knocked him from his chair.

"Darn!" I screamed, grabbing the joystick like it was the last Pina Colada in Tahiti. I targeted the pirates with my newly-installed Photon Cannons, and blew them 10 levels past Hades.

I started to let myself relax, but I noticed something peculiar. The graceful alien had been knocked out of his seat and was being jostled about the cabin . But he was moving now, on his feet, and it looked like he was supposed to be walking forward, but instead he was moving backward.

"Just Beat me, just Beat me...." he murmured.

I started reaching for my hand-phaser, slowly and cautiously. He spun around and stopped so abruptly I thought the gravity simulators were off line.

"You wouldn't happen to have any peanut butter and bananas lying around here, would you?" he queried.

I screamed and hit the floor, grabbing my weapon. But the Prince (God help us) slid over to me like a greased proton beam and wrenched it from my hand.

"So, you figured it out, huh?" said the Prince.

I stared at him, aghast. He just smiled that weird-smile of his; it was like something out of an old beach flick.

"Yeh, it's me. One of my daddy's old fans set me free from the suspended animation chamber. And wouldn't you know it, after my daddy, Michael, and my momma, Lisa-Marie, hid all the Terran currency some years ago after collecting it from owning rights to just about everything (gasp); I'm quite rich! But I thought it would be nice to put some Thriller into your life by stealing your ship."

He started to laugh; it was a ghostly, haunting laugh, and made him throw back his head. I took the initiative and pushed his skinny 80-pound body across the floor, slamming him into the bulkhead. But he quickly recovered, and raised the phaser. Click.

"Shoot!" he exclaimed, wrenching off the battery cover, the SupraVolts falling to the ground.

I sprang forward, slamming my fist on to the escape pod eject button. The small section of the ship he was in closed off and spewed forth into space, taking the demon-spawned love-child with it. I made a silent prayer to a certain bass drum-toting pink bunny.

Collapsing on to the console, I heaved a sigh of relief. I sat up, entered some random coordinates, and warped into space. The war was getting bigger.

It was much more intense. I was going to get my fair share of the...

FINAL FRONTIER II

(Final Frontier I was just a teaser...)

* * *

Think you're bad enough to survive this NEW, VASTLY IMPROVED version of Final Frontier? No longer do you have to wait for the wusses on your board to show up and play. No longer do you have to depend upon your teammates like in S.E.E. (Shameless Plug). Want to see if you are TRULY bad enough to hang with all the pros? It's a whole new game, networked and armed to the teeth...

You know the old story...

"This is where you come in to play. You have been given a ship
and some vessels; the most that your government could give you in
this deep space area. You must, either by yourself, or with the
help of others, control at least 400 of the planets in the Outer
Rim to win this war. By colonizing and fortifying planets, you'll
be able to manufacture more goods and ships for yourself. You should
expect aggression from other ships and planets, and should not hesitate
to attack others to reach your goal of 400 of the planets. Good luck.
You'll need it.

Now live it! An expanded, networked galaxy awaits you, along with many players from all around the universe. So get ready, read the docs and new features, then let's get down to some serious arse-kicking!

See you out there in CyberSpace, friend...

I have two "new" SCSI HDD's here. Both have 68 pin connectors. One is
2 GB the other 4 GB. I'm planning to install them in the CM Stacker
(Big Tower by Coolermaster), along with my CD-ROM and DVD-ROM mechs.
68-to-50 pin convertors are already installed. But I still need to get
an extra cabel so I can hook everything up to the power suppy. And I
probably have to drill new holes in the 4in3 thingy, because I want to
install two 3.5" floppy disk drives, and Coolermaster didn't expect that.

Nice to hear that the SCSI-2-IDE convertors work with the BlackBox. If
you send me a textfile explaining what you did, maybe even with some
pictures, maybe I can add them to my site at www.mathyvannisselroy.nl.

> issues. Note that I'm referring to a low-level format only.

Modern drives will not allow you to LL format the disk. The
manufacturers put some info on that disk (probably which sectors not to
use) that needs to stay on there for the disk to work. If you'ld format
them, this information would be lost. Just use FMTDIR to partition
everything and forget about HDFMT.

CU Mathy

PS my 80MB IBM HDD is very noisy, but still running after years. I
recently heard that 10 yera old SCSI disks are still going strong, but 3
year old IDE/Atapi disks have been developing errors already.

The M.T.B.F. (Meantime between failure), going with SCSI-stuff, is
factly higher.

Most headache makes me s.m.a.r.t.. :) (what a shit, I finally survived
a 60GB HD which was damaged (due to smart) with an other PC [not one
bad sector"!"])

6296. MyDos HD Backup Using APE

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-06 10:37:10 UTC
From: Larry <LLppwhite@earthlink.net>
Message-ID: <1144319830.601001.188760@g10g2000cwb.googlegroups.com>
Source record: 7153

I was backing up my hard drive to an APE large virtual disk of 60000 DD sectors. My backup program was the Hard Disk Backup Pro. In this particular case, most of my directories were 3-levels deep: Root:Sub1:Sub2:Files. I realize that creates some additional overhead for the file system, but I was amazed at the amount of "thrashing" going on by the time I got toward the end of the disk. The backup of apx 55,000 sectors took almost three hours using 3X speed. Whew!

I can't say for sure what was going on, but it appeared that every time a new file was written, the backup went to the root directory, then to Sub1 then to Sub2 and finally wrote the file. In the case of appending, a very small part of the file was written, and only (it appeared) after re-reading the file to that point. (?)

So was this a MyDos issue, or an issue with the virtual disk (a large random file?), or an issue with the backup program? I have a HD backup program that I wrote, but it does not support more than one level of subdirectories, so I can't compare these results with it. Certainly I'm going to compare this to sector copying -- can't be any slower.

Can anyone shed any light on this?
Thanks,
Larry

Been there done that! What hard drive system are you using with APE..
MyDOS has a few problems with MyIDE rom versions below 32f. The black box
should do it okay, there seems to be better buffing of data stream. The
noise is probably caused by fragmented files on the hard drive (you might
even have several directories fragmented.) Sector coping has been discussed
here several times. A program called SECTOR17.COM works well on the
emulator from ATR to ATR but slow from APE to hard drive or hard drive to
APE. 64 directory entries per directory SUCKS big time. But I concider my
time doing this was well spent. I now have a hard drive with 26 directories
filled with atleast 1600 game XEX files.. and picodos and associated text
files for long file names. Enjoy it can only get better- I HOPE.

Thank you for posting this! It was cool to see the map over this great
game.

About Swordquest, was there only eight rooms in that game?

Anders

The two folks that posted here, that were interested, both backed out
due to shipping costs(both wanted ALL the items, so the package was
about 10lbs.), so this stuff is still available.

If anybody wants any of these items, please let me know within the next
week, otherwise it's off to the garbage dump.

Folks, we've had really severe weather here in the last 24 hours.

(tornadoes, high wind, intense rain, cats and dogs-living
together...<cough>, er wrong movie...) :-)

Anyways, we were without power for much of the last 24 hours. Which far
exceeds the UPS I've got on the BBS.

Our normally stable dynamic IP address changed, one of only 2 times its
changed in over a year.

Its now: 24,177.23.112

Until my server gets this updated, you'll be unable to telnet to
"bbs.darkforce.org" although the actual IP address will work.

Thanks for your patience and sorry for any inconvenience.

6303. LONG: Atari 8 bit game documents

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-09 04:15:33 UTC
From: Rory McMahon <rorymcmahonNOSPAM@yahoo.com>
Message-ID: <141h32pf0dogsc5gshr9tko4ctv0u1lqo8@4ax.com>
Source record: 7160

Hey all,

I been working in the basement this week and found several binders and boxes of 8 bit game documents (photocopies of manuals, box covers, etc) from owners of old bbs's who collected this stuff long time ago. I just came into owning a duplex scanner and started to convert the docs to PDF.

Most of the photocopies are of poor quality and mostly incomplete (some have box scans, warranty info). Most SSI and Avalon hill games have 'hex' grids with text embedded in them, and most of those are illegible after scanning. I still have at least two more binders to go and several boxes of manuals to scan. Some of these titles are old, and some I've never heard of before. The scans still need to be compressed before burning them to CD or DVD...

My questions are... Is anybody looking for games documents? Is partial docs better than none?

I intend to replace PDF's if I come across an original.

The list of actual files are on my ftp server. You can log on and view the list, but cannot download them. I dont want someone to start downloading the entire catalog. If you want a few, no problem. If you want more than 2 or 3, I can burn them to a CD or DVD for a nominal cost ($1-2) + shipping. Most of the ones in the 'P' directory are better than the ones in the 'W' directory.

Here is some info:
ftp: fujiman.no-ip.com
login: ataridox
pass: listplease

If you need to get ahold of me:

fujiman(no@spam)netzero.net

get rid of the parens and the obvious.

Thanks,
Rory

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

On HDD's that need the parity mod, you usually don't need to use
HDFMT.COM.

The error message looks familiar, but I can't remember under what
conditions it appeared. A long pause usually happens, when the HDD can
not be accessed for some reason. Is everything connected corrctly? If
you want to, I can sent you a piece of software (very crued) that will
read the (512 byte) sectors of your HDD, so you can check if the
configuration data is written to sector zero correctly.

Ten year old SCSI drives? I have an old Macintosh LC with its original 40MB Quantum drive, and it purrs like a kitten. No bad blocks, no hesitation at startup, no disk read/write errors, and this disk is about 14 years old now. A 160MB Connor SCSI disk that was in my LC575, is just stating to show some problems now. This drive was bought new in 1995, so it's about 11 years old.

The 160MB Connor drive still works great, but there's a little hesitation at powerup. It sometimes takes a couple minutes or so for the drive heads to swing into place an begin reading the disk. Once the drive is up and running though, it runs great with no problems at all.

Message-ID: <qkkq32lqj666e37hsmsffelejb3ng2f5kh@4ax.com>
Source record: 7169

I have an MIO on Ebay...

The auction is supposed to be a low bidding event...

My apologies in advance...
=====
I wanted to tell you that I have a high shipping cost placed on this
auction. I will be charging $330 + shipping + auction ending price.

I dont think people are aware of it. It's my way of getting money back
from ebay by not paying them fees.

There is a reason for it.

I got screwed on a scanner I bought online for $410 of which I have
only got $175 back(and will probably be all I'll ever see). Through
the loopholes of Ebay/Paypal they will 'recover' $200 minus $25 fee of
any purchase. Yet another reason not to use ebay/paypal. I've been
burned and this is the only way to recoup.

Thanks,
Rory
=====

The shipping will be $330 + shipping put ending auction.

People may be bidding without checking the ship/handling calculator.
I think I understand the ship concept you're trying to achieve, however
your statement in the description is misleading.
I quote your description:

"The shipping costs will depend on where you live. I have set a fixed
shipping amount, but you can save shipping by winning more than one auction.
Thanks for your understanding."

Your explanation here is acurate, but people may be shocked by the
shipping amount. Shipping won't vary much " ... depend on where you live.."
Sorry.

Was the PC2 the Atari PC that was housed in the modified Mega ST case? If so, I recall having wanted one of those as well. I remember reading an article in an old Compute! magazine about it's introduction -- a CES or Comdex show report, I believe.

Anyway, Atari was expecting to sell a tonne of those boxes. At least that was the hype from the magazines of the time.

Did anybody ever produce a Unix-like OS for the Atari 8-bit? Not an actual Unix, but something that looks and feels like a Unix? I know there was SpartaDOS, which was a command line OS. Though I would hardly call SpartaDOS Unix-like.

I remember ordering a DOS from Bellcom that was written entirely in Basic. It wasn't Unix-like, but MS-DOS like. It wasn't very useful, being that it was written in Basic -- at least the user interface portion was written in Basic. The actual DOS.SYS was Atari DOS 2, I think.

Hmm, what was that called? Mecc-DOS, I think.

Anyway, was there ever any effort to create something Unix-like? i.e. a DOS that used Unix like commands?

Last I heard, the Floppy Board can *possibly* be purchased from CSS. I
know that Bob has enough parts to build one more batch of Floppy Boards,
but there needs to be enough demand from users for him to do it. If you
(or anybody) wants one, let Bob know!

I didnt mean to deceive anyone except Ebay.

The current high bidder has been notified and said, basically, cancel your bid if you want. I'm not going to hold anyone to the bids that they made under this situation.

Seems a lot of people on Ebay puts things on ebay for ridculously low prices (.01 for Buy it now) for expensive items to cheat ebay out of closing bid prices and make the money on shipping (which ebay cannot touch, yet...). I'm not wealthy enough to let $233 slip through the cracks. I really needed the scanner*. I waited 3 weeks for nothing to show up, meanwhile the bad seller has my money and already spent it. I get a partial refund from ebay and was told to recoup the rest from the seller (who probably used fake info). I had no protection from being frauded. Paypal defaults to a bank transfer instead of a Credit card (which I would have had protection). Things just went horribly wrong.

I'm NOT going to let the money slide.

I'll always check to see how much stuff is going to cost to ship. I want to know the ballpark price I will be paying. Expensive items (more than $200) I will only pick up in person which pretty well defeats the purpose of Ebay.

I guess I could just pull it off ebay and sell it some other way.

Rory

I'm back! I have a new name now, too! I'm now known as AlbaClause. As you may have figured out from reading the signature at the bottom, AlbaClause is a contraction of the words Albatross and Clause.

For the illiterate and dictionary deprived folks cruising the group, I'm going to pull out my big red Webster's New World Dictionary and provide you with definitions of the words Albatross and clause. Here goes:

Albatross: 1) Any of a family of large, web-footed, tubenose birds found chiefly in the south seas. They have long narrow wings, and a long, hooked beak. 2) A burden or source of distress, especially one that impairs effective action.

Clause: 1) A group of words containing a subject and a finite verb, usually forming part of a complex or compound sentence. Clauses may be joined by parataxis, by modified parataxis, and by hypotaxis. 2) A particular article, stipulation, or provision in a formal or legal document.

I'll let you figure out which definitions I'm using for my handle. You can do it... I think you're smart enough!

You may recall that I used to frequent these groups under the handle "you". However, I've opted to cease use of that handle, as I really don't like you. Yes, sad but true.

In a closing note, if you happen to chance upon my website, and you have any knowledge of Debian Linux, you will immediately recognize that "woody" is the name of the old stable Debian distro. Although some rather large posteriored morning show hosts may believe that it is a reference to them, I assure you that it most certainly is not.

Note to Sarah Woodley: You're so vain. I bet you think this post is about you! :P

Anyway, ciao for now.

6332. 800XL and 130XE differences

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-13 15:44:36 UTC
From: jdplace@REMOVESPAMcableone.net
Message-ID: <123ssf4r16p1c0e@corp.supernews.com>
Source record: 7189

I'm thinking of buying an 800XL and installing a Wizztronics 256K memory upgrade because I like the keyboard, and the cartridge port on the top instead of on the back like my 130XE. I know the 130XE has an additional expansion port on the back, but I'm not using it. Would the 800XL function essentially the same as my 130XE with the added memory? What are the differences besides memory? The video port has some differences, correct? I use the AtariMax MyIDE + Flash cart with compact flash for a "hard drive."

TIA

LUnix for ATARI

http://www.strotmann.de/twiki/bin/view/APG/LngHowToBuild

Apparently only works on emulators.

To the best of my knowledge, the functional diffs (other than RAM) are as follows:

800XL: Basic Revision B
130XE: Basic Revision C

800XL: No seperate chroma and luma on monitor output (on most anyways)
130XE: Seperate chroma and luma on monitor port (SVIDEO)

800XL: Parallel Bus
130XE: ECI port

>From the factory, the 800XL has a much better quality video signal (TV at least).

Plus, most 800XLs have socketed chips making upgrades and repairs a lot easier.

If you use cartridges, the XL is also a much better choice.

I am not sure if it is the case with all 800XL and 130XE units, but on
the ones I have seen, the 130XE gives slightly better screen quality
when connected to a TV set with an RF cable.

If you ask me which is coolest, here is how I would rank them:

1. Atari 800 - super cool
2. Atari 400 - super cool with console feel
3. Atari 800XL - cool
4. Atari 600XL - the small footprint is cool
5. Atari 130XE - not so cool (but the most useful one)

Anders

6342. "Some Interesting Times"

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-16 15:38:29 UTC
From: Larry <LLppwhite@earthlink.net>
Message-ID: <1145201909.106611.33980@i40g2000cwc.googlegroups.com>
Source record: 7099

After my "slow backup" issues trying to copy my HD with a Dos-style backup utility, I decided to go after it with a sector copier. In truth, there are many excellent sector copiers available, but for this job, I thought I'd write my own, a Q&D one in BASIC -- no machine language -- just POKEs to the Device Control Block. It only took about an hour to get a fully-functional copier, so little time was invested. Here are the times for 1000 sectors R/W FROM the hard drive TO an APE ATR image using (registered) WinAPE at "3X."

Atari Basic 156 sec. screen on
121 sec. screen off

BXL 103 sec. screen on, FAST mode
86 sec. screen off, FAST mode

BXE 89 sec. screen on, FAST mode, BXE extensions
81 sec. screen off, FAST mode, BXE extensions

Turbo Basic XL 91 sec. screen on
79 sec. screen off

ABC Compiler 77 sec. screen off

After running the copier/benchmark several times, it bacame apparent that BXE and Turbo Basic XL are quite equal in speed for this task -- sometimes one was faster, then sometimes not. I also expected that ABC would generate some improvement, but there is essentially none. Evidently the more modern interpreters can POKE about as fst as ABC. The next step will be to replace the "POKES" with ML routines and see what improvements that makes. -Larry

Actually, ABC doesn't translate the code to machine language. It is
still interpreted. ABC translates the basic tokens to a p-code that is
again run thru the runtime package. It is still faster because this
runtime environment handles only integer mathematics and is quite optimized.

So long,
Thomas

I think cartridges have more trouble with oxidation of the card-edge
contacts than the on-board chips. Dunno what the life span of a plastic ROM
is.

OK, how'd you do a sector read/write without at least one USR call?
You can set up the DCB, but it still requires a USR call to SIOV..?. E459

Hi Thomas and Russ-

Over the years, I've tried to find some clear, concise information on P-Code Compilers (like ABC), but have yet to find anything that provided much useful info. Most of what I've read goes into creating machine code by converting BASIC to Assembler equivalents; then naturally to ML. One of the Data Becker (IIRC) series for the C64 was quite good, and I "slugged" my way through that. There was also a really good series in AHOY! on creating a C64 Basic Compiler, but the mag ended its run before the series could be completed! Don't believe that I ever read anything serious about compilers for the Atari 8-bit. Maybe there were in Europe or UK.

Sure, I had to do the X=USR(CALL$E459), but that is still a Basic command. Just no LDA, STA...to set up the DCB. Just POKE, POKE, POKE, and POKE some more. :-) -Larry

OK, I call USR calls machine language. X=USR(ADR("hLY(d)")) is
PLA JMP E459. You can do a lot of ML stuff that way, often loading
a string with DATA reads, then X=USR(ADR(A$)). A common one
is an IOCB call X=USR(ADR("hhh(*)LV(d)"),16) for a CIOV to
Channel 1. Certainly a lot faster than BASIC GETs and PUTs.
I never got to doing MAC65 programming. I would do stuff with
ASMEDitor then maybe put it in a string for use in BASIC.
but I ramble.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I have recently downloaded a load of exe's/com's and XEX files from
the internet

Apparently atari800win+ allows you to use these files thru Atari dos,
set up as a Hard disk directory

As I understand it all you do after loading up the emulator, is to go
to Atari, then hard drives and select which HD you want and tell that
HD where the downloaded XEX/exe's etc files are, Now I know that
atari's own dos's don't support hard drives but mydos, bwdos and
spartados does

Now I have figured out how to get Sparta and bwdos to look at the hard
disk directory with the exe or xex files in and I can get it to display
the contents of that directory in ataridos format (8x3 characters)

I just want to know if I can get mydos (v 4x and higher) to display
this hard drive directory and if mydos is compatible with
atari800win+'s hard drive option, if so how can I display the
contents of the hard drive directory (in mydos) and also for copying

I have also found out how to create (in mydos) very large Atr's (15
megs in length), however, I notice you cant use this disc with Sparta
or bwdos, is there a way of Sparta or bwdos creating v. large Atr's
(15 megs in length)

Additionally is there a way of multiple file copying from a hard disk
directory to a disk drive using spart/bwdos, according to their manual
you can use the following

(assuming you're already in H1:)

H1: copy *.* d2 (or whatever):*.*

All I get is error ** or file not present

Or is there a utility or ATR that will enable me to copy hard disk
directory file of atari exe/xex etc files to a large ATR disk created
using atari800win+ (formatted using mydos)

Also I am looking for a PC utility or Emulator ATR that will allow me
to convert Xex/com/xex file to CAS format

6353. Hacking into ATR/XFD etc emulator files

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-17 12:11:46 UTC
From: carmel_andrews@yahoo.com
Message-ID: <1145275906.614371.316640@i39g2000cwa.googlegroups.com>
Source record: 7110

I am looking for a PC utiliy or emulator ATR file that will simulate ATR sector loading or Atr loading and displays sector number and load address and any run/init addresses (during the load), mostly for Atr's that load in extra data like Zork, Gauntlet, Threshold etc as well as normal ATR's (games that don't load in extra levels)

I am familiar with the disk i/o locations (0300h to 030bh) and also the run/init locations (2/3 and A/b/c/dh and also 02e0/1/2&3h) but some programmes tend to scramble this info

Also I am looking for a PC util or Emulator ATR that will copy back xex/exe/com files to cassette/cas boot file, preferably to handling files/file more then 300 sectors (400+) and those that have complex binary file structures (like packed files generated with superpacker/cruncher 5, that have been appened together)

Wildcards don't seem to work for me, but straight H:FILENAME.EXT
D2:FILENAME.EXT works for me. Read the HELP file for your emulator, lots of good information.
Also make sure you have assigned a folder on PC to be the hard drive for emulator. If you have been able to assign the OS and Drives.

See my other post... Alas, checking the QL directory, I'm not too sure how
good the site is...
I just tried a couple of the zip files there, and they both came back
broken.
(I think he screwed up his encoding on the page and marked them as text/html
or something, downloading in forced binary mode didn't help either)

How much of the DCB must be updated each time DISKINV or SIOV is
called? Certainly things that change like the buffer addresses and the
sector addresses would need to be updated, but how about the things
that don't change? For instance DDEVIC ($300) is going to change;
DUNIT ($301) may not change for many iterations; likewise DCOMND ($302)
may not change until changing from read to write after many calls.
I've never seen this info before, and most programs that I've seen just
re-write the entire block each time. Anyone?

About the only thing you need to re-write each time is DSTATUS(sp?), 0x303.
This is because this variable defines the transfer direction on a call
(0x40: Reading, 0x80: Writing, 0x00: Status only) and contains the error code
on return, so the original contents is lost. If you use DISKINTERF, 0xe453,
then you don't need to fill it as the resident disk handler does this for
you. However, DISKINTERF cannot handle the "write without verify" command
for OsA, and the "format extended density" command up to the XL Os, it is
therefore of limited use. Most DOSes I've seen use SIO instead (0xe459).

So long,
Thomas

> normal ATR's (games that don't load in extra levels)

Well, sector numbers should be easy to obtain. I think a simple "printf"
in the emulator core will do it. For atari++, there's one class that
interprets sector loading, and hacking it up for that purpose should be a
piece of cake. Load addresses, however, are not so easy to obtain in
general. Of course you could still hook into the SIO patch of the emulator
and get it from there, but this won't work in case the game uses its own
sector loader. Examples for this are rare, but there are some: Most Lucasfilms
games come with their own disk device communications, and so does FS_II.

> superpacker/cruncher 5, that have been appened together)

As long as the file itself is a valid .COM file and doesn't require any
additional tricks for loading, this is an easy exercise.
Load the "COM" file as disk image into Atari++, then use a disk copy
utility to copy this "disk image" into an ATR. Atari++ builds a binary
loader for the COM file in front anyhow, and you can use this loader for
your own purposes to make "COMs" bootable. That is, as long as the "COM"
boots from Atari++ fine as "disk image", it will also do on real hardware,
and on other emulators.

So long,
Thomas

Not necessarely. Some later releases have the chips soldered in. I do
have such a release. It was a pain to repair when the Basic ROM broke.
BTW, this release also came with a Rev C Basic.

So long,
Thomas

6369. atari++ 1.45 ready

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-18 08:20:21 UTC
From: Thomas Richter <thor@mersenne.math.TU-Berlin.DE>
Message-ID: <e227g5$5f2$4@mamenchi.zrz.TU-Berlin.DE>
Source record: 7126

Hi folks,

please find a new release of the Atari++ emulator for Linux and win32
in its usual location, this time release 1.45:

http://www.math.tu-berlin.de/~thor/atari++/

This release is mainly a bug-fix release that addresses a couple
of problems that have been pending for quite a while. Most notably,
the release addresses incompatibilities to the latest GNU and
Microsoft compilers, fixes a couple of bugs in the H: handler
(append mode didn't work, binary load had problems) and in the
Os++ emulator Os, namely in the FMS. Then again, I had one bug
report concerning timing of the HSCROLL register (got fixed) and
another one concerning P/M DMA that is likely to be fixed now.
Thanks Sebastian for reporting these.

I think it is also time for another new "stable" release. Thus, if
you find any bugs in this one, I would be pleased to collect your
reports. Similarly, new feature requests are also welcome, but probably
won't make it until 1.50.

So long,
Thomas

No, that was the PC-1. I have one of these in-transit to me now, should be here in a day or two. The owner sent some very nice pictures of the system. I can probably post them somewhere if anyone would like to see them. You gotta love an Atari made PC in a MegaST/Megafile case. The one I'm getting is even modded, a toggle on the side of the case to turn of the keyboard click.

Charlie

G'day Tarkin, sorry about taking so long to reply, but since, as Shawn said, the items were all spoken for, I didn't think there was much point perusing this newsgroup to see if there was any interest posted. I include my email address in my posts so folks interested in the items can contact me directly, rather than yakking on here, and the two people that took the items(both before you posted here anyway) emailed me, plus I've had some computer troubles here, and looking over the newsgroup was the last thing on my mind.

Adios, Bob

The only time I ever wrote using DISKINV was a small disk sort program
for AtariDOS 2.5 called 'A-Sort 2.5'. I wrote it in MAC65 and was one
of my first assembly programs. That was circa late 80's/early 90/s. I
added an option to turn off screen output to help speed it up. Worked
remarkable well and at top speed of the 6502 processor. Even if you
leave 3 or 4 lines of screen output and do a jmp waitvblank its much
faster than having an entire screen with nothing essential going on.

okay, I can solve most 1050 faults, but this drive has me beaten so far,
speed fine, reads perfectly, but will not format or write, I have changed
the drive mech for a known good drive, checked all connections, replaced U13
with a known good chip, and even added a write protect, enable override
switch, and still it will not write to a blank disk or complete a format.
Anyone got any idea where to look next ?

thanks in advance

Richard

IMO try a couple of new floppies from different sources before you go
any deeper. This is the same type of error you get when you have a bad
spot or batch of bad disks. Atari's don't mark spots as bad during the
format and keep going, they just bail out with an error.

Hi Tom,

I came down the exact same road as you, and my research and help pointed
to an Atari 800XL with an SIO2PC cable as the best all-around setup.

Thanks for your reply.

I am curious about the Atari 800 though. It has two cartridge ports,
plus additional expansion bays above the cartridge ports. Will I be
missing something by only having one cartridge port?

What is the Parrelel Bus and IO port good for?

Thanks,

Tom

The 800 didn't have BASIC integrated into it, so you could leave that cart in all the time. You don't miss anything not having two ports that I've ever heard of.

The expansion slots stored 16k of ram each for a total of 64k (16k is built in) which is also standard on the 800XL. The only thing you really miss is that the original 800 had 4 joystick ports and nothing else has that, so if the few 4 player games interest you, then the 800 is the only way.

Good luck!

The 800 had a max on stock RAM cards at 3 x 16K for 48K; there
were some
mods that took it up to 1088K and probably beyond... There were
also some
8K and even 32K cards; BUT still a max of 48K accessable unless
you use a
bank switch method.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

6397. XEP-80 and Antic

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-25 15:26:38 UTC
From: Jason Harmon <no@spam.com>
Message-ID: <0LydneoU4JT-otPZ4p2dnA@adelphia.com>
Source record: 7054

I had a question about the XEP-80 related to system performance and was wondering if anyone here knows the answer.

Turning off the Antic chip in a 8-bit Atari causes a significant increase in performance since it is no longer interrupting the 6502. Since the XEP-80 is an external device, I would assume there is no need for Antic to be turned on while it is in use.

Does the XEP-80 driver by default turn off the Antic chip when it is enabled? If so, what type of computing performance increases would you expect while using the XEP-80? (Obviously the display is slower than is possible with memory mapped video, but that is another issue).

Jason Harmon

> missing something by only having one cartridge port?

Some people get a 400 or 800 just for playing Mule because it has 4 joystick ports. It's a good machine but kind of bulky. Expansions like memory or hard drive are hard to find. It is a sweet machine for the time it came out, 1979: Nice keyboard, decent video output. BTW: As someone has said, get a SIO2PC cable and it will work with an 800.

There were not a lot of carts that used the extra slot. Actually the functionality of the 2nd cartridge port was built into the single cartridge port of the later models.

>
> What is the Parrelel Bus and IO port good for?

Unless you want to become a power user or hacker, not much. There's some expensive expansion boxes for memory/floppy/RS232/Hard Drive type stuff.

You may want to consider a 130XE. You really need 48k of memory in your 800 to be able to use DOS. A 130XE has 128k built in and is compatible/can be made even more compatible by loading an 800 OS from disk. I have a collection of various Atari 8 bits but if I were to pick the essentials to own they would probably be an 800 and a 130XE. It's not that they were the best, just that they represent the alpha/omega of Atari 8 bits.

Well what I'm worried about now is that I've seen some gams that look
interesting at some websites but are labeled as Atari XE. If I got an
800XL I would not be able to run those right? I havent seen any
devices that use the expension interfaces of either XL or XE so dont
know if that matters as a deciding factor.

Right now it's 800XL vs 130XE for me now..

Thanks,

Tom

Lukasz, thanks for the information. The game seems cool and I look
forward to download it to my K700i mobile phone.

The Atari version too looks interesting. Did you disassemble the
Atari code to find out about details in the game logic?

Anders

I have some dysan DSDD disks in sealed hard plastic case, in sets of 10 cases with 10 disks each for 100 disks total. If anyone is interested they are $20 for the 100 in hard cases of 10 each, price will include media mail shipping the whole box is a bit heavy.

Let me know if you want any, these have been stored in ac storage and I've used them myself with some astra 2001 drives which are true double density and they work flawlessy.

I rather not list on ebay so let me know asap if anyone is interested $20 shipped per box of 10 hard cases total of 100 sealed new disks. The hard cases also elminate your disk storage problems.

The XE on the label was probably to keep people from getting confused since the XE was the current one being manufactured. In truth I think most of those games probably will even run on an 800.

The 800XL is a good machine and probably the most hacked of Atari computers. Stuff like alternate OS and 256k memory expansion is around.

Cheapest to build your own of course
http://www.geocities.com/atarimods/atari.html

eBay is a good source for inexpensive cables. The seller is a newsgroup
participant and manages to get them to people from Poland<?> for less
then people in the USA are willing to make them.

They're $40 on eBay. The cheapest I've found so far is $25 from
www.atarimax.com, which is much better priced. Although I paid $6 for
my XE1541 cable to connect my PC to a Commodore 1541 disk drive, so it
seems high still. :) The interface does look more complex
though..That's why I asked if there is a cheaper type of interface.

OK I have to admit I was impressed by "16 colors with 16 intensities"
and I knew that 320x192 was monochrome. But what I didn't know is that
16 colors was in 80x192. How does anyone even consider this to be a
usable mode? I know a lot of Commodore 64 games are programmed in 2
pixel dots because you can only have 2 different colors in a 2x2 area
(4 pixels). But otherwise it's 320x200 at 16 colors. Also text is
40x25 with 16 colors. What I found the MOST shocking is that there is
no 16 color text mode. This is MIND BOGGLING. Sorry, never had an
Atari and am looking to get one but this was my first discouraging
discovery today..

Thanks,

Tom

Oh and how do you have a graphics mode of 40x24??? why bother?? and
why does a lower resolution mode not support more or atleast the same
colors as 80x192?

I know this is 70's technology.. but geesh!!!

why did they release the xe series in 1985 without at least 320x192 16
color graphics and 40x24 16 color text??

ok end of rant lol... may still get one :)

The Atari has weaker graphics and weaker sound, but there are some
interesting games for it. It has a vastly superior disk system to the
C64, for sure. :)

Hi,

I have built a few for people who needed a cable, but...

You can build one for about $8 from parts and about 1 hr if you can wield a soldering iron. I would suggest building one that piggy-backs the SIO port from cutting up a SIO cable. I typically mount a db-9 just above the SIO port and use a db-9 extension cable to connect it to the PC.

Or get one from Steve at atarimax.com for about $25-30 that has both SIO2PC and PRO System in one little package. No need to build two separate cablesand saves cable swapping when/if you need to use the PRO system.

I would choose the latter if you cannot/shouldn't use a soldering iron :) and you can afford it.

Rory

Don't discount the graphics so quickly. One of the more popular video modes
is 160x192 in 4 colors. However, with the use of Display List Interupts, it
is possible to change the palette between scan lines, effectively allowing 4
colors per scan line.

http://www.atarimagazines.com/compute/issue47/153_1_Atari_Display_List_Interrupts.php

Remember that the Atari was created well before the C64. The C64's graphics
look primitive compared to a modern PC, so you have to compare it with what
else was around at the time it was created.

Well SIO seems more versatile.. But is there a 1581-like drive for Atari?

The CPU is faster, and the basic is better too. So these are some other plus points. Luckily the program I want to write on it doesnt use graphics at all, but does use text and was a little shocked by "5" color text. How on earth do you come up with 5 colors? How does that fit into memory? Usually colors are powers of 2. (2, 4, 8, 16, etc)... Are they just the same 5 colors or can you change them from a pallete?

I was already at the "buying" phase. But after reading that today I'm taking a step back and will be playing with the emulator a little more in depth to see if I want one.. I will say at least for 1979 the Atari 800 was a nice piece of history. I think the VIC-20 probably still had 16 colors at a higher resolution though.

On the other hand atarimax.com has a neat IDE/flash interface and SIO2PC interfaces for pretty good prices..

Thanks,

Tom

OK that makes A LOT of sense and makes me feel A LOT better!

It explains why many of the games look the same on the Atari and the Commodore 64... As I said earlier, although the C64 is infact capable of 320x200 at 16 colors, many games are essentially 160x200 anyway because of the 2 color per 4 pixel limitation. Often the games only have 2-4 colors in one area of the screen anyway.

So each scan line can be 4 colors of a pallete? I assume that pallete is 16?

Is the text mode the same way? 5 colors, but 5 colors from a pallete of 16? If so that'd make me feel a little better too, because I doubt I'd write a program that uses more then 5 colors at once anyway..

Thanks,

Tom

Oh and the Atari 800 may have came before the 64, and was indeed impressive at 1979, but the 800XL came out around the same time as the 64, and the XE series came out way after the 64.. They could have implemented better graphics modes then. I can see why the XE (not to mention quality issues) series was a major let down to many Atari users. The 800XL at least wasn't *that* far behind the 64..

Now about sound. Doesnt the 64 have 3 voices, and the Atari has 4? But it's agreed that the 64 had better sound.. Why is that?

At least the Atari has a faster clock speed and more BASIC commands..

Thanks,

Tom

Did they for later Commodores 64/128's?

I can see why the XE (not to
> mention quality issues) series was a major let down to many Atari
> users. The 800XL at least wasn't *that* far behind the 64..

Bugger all difference when you get down to it. Like most limitations the
programmers got around them eventually.
>
> Now about sound. Doesnt the 64 have 3 voices, and the Atari has 4?

Yes.

> But it's agreed that the 64 had better sound..

Argued more often than not;-)

Why is that?

Opinion?

>

> So each scan line can be 4 colors of a pallete? I assume that pallete
> is 16?

The palette is 256.

With the right technique (aka G2F - Graph to Font) using
Player-Missile-Graphics ("Sprites") and redefined characters you can come up
with the most impressive results. Check this out:
http://www.atarimania.com/detail_soft.php?MENU=8&VERSION_ID=16847

Even without G2F the most flexible ANTIC and its Display List in combination
with the GTIA is quite a bag of tricks. You really should check out some of
the demos made for the Atari to see what's doable.

As for the sound: This really comes down to a matter of personal preference.
The Atari's POKEY (responsible for sound amongst other things) was found in
quite a number of arcade games of its time, hence no wonder Atari used it
for its computer line.

Many say, the POKEY is capable of better sound FX than the C64's SID.
Personally, I'm a bit undecided. I love the huge SID sound, but I'm also
really digging the edgier sound of the POKEY. Check out the clicking
percussion in "Jet Set Willy", "Red Max" et al.

Yes, i am interested. My email address is mores_p@hotmail.com. Please tell me what to do.

I assume this disks can be used with Apple 2 right? I am not an experienced an apple ii user.

Mark

Then look at the Atari 520ST, which was sold at a lower price than
the C128 in the UK. I like the C128 and I was a bit disappointed
when the specification of the Atari ST computer series was
presented. But all in all you could se the ST as a huge improvement
over the 8-bit computer, still priced like an 8-bitter.

Tom,

It for archiving your copy protected software to an disk image. It does pretty well in doing mosts disks I've run across. For those who don't have a bit copier/Happy disk drive. More information on Atarimax.com website.

Only one problem, only compatible with APE and a real Atari. I would like to see the .PRO system implemented in a Atari Emulator, so I can used my atari software without dragging an Atari along...

It would be nice to put a bunch of PRO images into my laptop and finally have a portable atari with a big LCD...<Sigh>

For the 128. It was better. It came with an 80x25 chip. It came with an advanced BASIC. The 128 was a decent 8-bit at the time of release. The XE series I would say was lacking where the C128 was not.

As for the sound/graphics. I TOTALLY understand now. I ran several games in emulator last night comparing the same game on the C64, and saw that the graphics were *almost* the same. I did notice some games had a little less color, and I counted horizontally, sure enough it was the 4 color limit. I also noticed Commodore picked nicer hues of colors.. Like orange on the C64 looks much nicer.. The sound did NOT sound ANYWHERE near as good as Commodore 64/128. So I totally get what people are saying there.

That said, I'm still interested in getting one...

Thanks,

Tom

OT:

Rick, I've been meaning to ask this for a long time.

To make the 14C89 SIO2PC compatible with RI and DSR need these be on a
switch? I mean can I just tie them to the same pin on the 14C89 and
have the circuit work for either line?

How could you have been dissapointed with the ST, compared to a 128?

Even the base model had more ram.. Better video, 16/32 bit cpu, midi,
async scsi...

it blew away the specs of the same era 'pc'..

6447. Re: WOW

I was never referring to the ST. I dont care about the ST. I said the
XE line seems dissapointing... Because compared to the 128, the 128
rules. The XE could have had at least better graphics modes added in.

For I time I had both a color monitor attached via the monitor port, and a mono monitor attached to the XEP80. You never had both screens live at once. When the XEP80 driver was running, ANTIC was off and the color monitor was blank. On the other hand, since the XEP80 had it's own memory, what ever was on that screen stayed there when you re-enabled ANTIC to work with the normal screen again. So it could _look_ like you were driving both monitors at once.

I once had a silly little program that flipped back and forth between the two monitors every few seconds, just for fun.

Dunno about the performance question, I hope someone addresses that!

Burning brain cells on this one, been a long time.<grin>

First I had better admit I don't recall if RI and DSR use the same logic
levels but...

It would/should work.

Since the RI and DSR are both RS232 inputs on the PC side they probably
don't present much load compared to the driving capability of the 14C89.
Just wiring them <OR'ed> together and running them at logic levels can't
hurt them.

I don't know if Windows is constantly checking the RI line to see if
Bill Gates is trying to send you a fax, but I can't see any problems
with a DOS box.

By the way if this is the ebay item you're referring to: 8800678628

They are nowhere near my price. He is charging about $8 for 10 disks, I am charging $20 for 10 hard plastic cases of 10 disks each (10 hard plastic cases, totalling 100 disks with shipping included).

The label on the box Dysan 100 refers to it's 100% error free slogan, not 100 disks in that box it's only 10 as you can see because it's also quite slim.

I am practically giving these away since I am moving and don't want to store them in a garage where heat may get them, they have been in ac storage with some of my other collections for the longest while and I saved 2 boxes of 100 each for myself. At present I have 4 boxes of 100 each left. Sold 4 boxes of 100 already. This is a no brainer if you need disks and are in the USA.

LOL! Well, at least you knew the answer at one time. I was just
guess.

Sorry, I'm being a bit lazy. One of my DB-9/RJ11 adapters (the end of
my SIO2PC) is just an exposed circuit. I could easily have just
connected the pins and SEE if it works, myself. LOL!

To Mark:
Thanks for the confirmation

Could be. Bill is still trying to get my money.

Thanks Rick!

But you were asking why Atari did not do something about the specs
of the 130XE. My point was that they were concentrating their efforts
on making a new computer, marketed at a price comparable to 8-bit
computers from Commodore. Btw, the Atari 130XE was selling well
in Europe, although far from the sales figures of Commodore, Sinclair
and Amstrad.

Yep, I noticed that afterwards :) Yours are super cheap. It's certainly an adventure selling overseas that's for sure, about £7-8 here sending something that weighs 150g, mind you, once at that threshold, something weighing close to 1Kg is about £9. Untracked stuff is about £2-3.

I think people who need disks will try to look for brand new. At least it's
what I would want. Used 5.25" disks are usually percieved to be unreliable.
However you might want to list on ebay for what your disks contain on them
software-wise. That might have some interest.

ATARI VCS or a CX2600.

Because it is the most silent 8bit ATARI. Also good for screen-saver.

Praktical and small as modern TV-consoles.

Best Regards,

Daniel Mandic

Can any of the old hands help me?

Back in the early eighties I remember
seeing a large-ish document
on how to write compact (assembler, natch)
code, aimed (IIRC) at coding for games consoles
like the 2600.

It included such techniques as subroutines (doh!)
using compact varients of instruction,
8 bit operation where possible (instead of 16),
code sharing (where subroutines overlap!)
and fitting data into code (i.e. scanning
your code bytes to see if you were lucky enough
to have a constant "waiting to be used").

The tone was humorous, but the knowledge
deep, and the tricks got pretty hairy towards
the end.

Can anybody recall this and (even better)
point me to a copy?

BugBear

Well, it seemed to work.

The only reason I asked is I wanted to try VAPI2SIO which happens to be preconfigured for DSR only and all my SIO2PC interfaces were set for RI.

[Update]
As it turns out, VAPI2SIO supports RI and DSR so I don't know what program I was thinking about that is DSR only.

and thats why I said "I saw that reference as well".

Tom, I never said that *you* said it, just that it was indeed posted.

BTW, congratulations (and welcome) on entering the world of Atari. You'll
love the 8bits, they are awesome! :)

FamilyNet International Newsgate

This is a message saying I have Warerat's CX802 512K XE upgrade running in
my Atari 800. Currently running Ice-T XE. :D

This is a proud moment for Atari 8-bit history, and certainly hoping not the
end of the upgraded Atari 800's (beige line, yes) ;)

Smiles everyone... smiles... :)

> 128?

I introduced the ST in the thread, because Tom asked why Atari did
not improve the 8-bit line. Isn't it more reasonable to look at a
product which represented Atari's improvement work, especially
as it was priced like the high-end 8-bitter from Commodore.

And yes, I was disappointed with the ST because I associated
Atari with advanced hardware for video gaming. Then I found
out that the ST was a powerful CPU, memory and a very simple
graphics generator and sound chip. I admit many of the early games
very quite cool: Flight Simulator II, Barbarian by Psygnosis and
the presumably not released version of International Karate by
System 3.

Has anyone taken a recent look at all of the "missing" APX titles at
http://www.atariarchives.org/APX/

I'm specifically referring to the significant number shown as "we have
permission, but we need a copy of the software." There are quite a few
utilities listed that I would think someone has in their collections.
I've donated what I have, but there are quite a few more that are
unlocated.

And perhaps someone has an idea as to contacting a "missing" author?
Unfortunately, some are probably no longer with us, but perhaps someone
may know a couple of these folks.

Thanks,
Larry

Pole Position, Pitstop, Great American cross country road race, New york City, F-15 strike eagle, Spitfire ace, Defender, Star Raiders, The Last Starfighter..... Oh and get Alternate Reality. Be careful though it is addictive.

The 130XE is the better unit. The extra ram disk is most useful.

Mark

The simplest way, as far as I know, would be to make a cable that has a 1/8" stereo jack, with both left and right signals tied together and going to the Audio In (pin 11 on the SIO port). You could make that with the 1/8" stereo plug and go direct to the line out on a PC/Mac, but I prefer using a jack to keep the cable short and using a patch cord to link the 2 units.

>Just FYI.

I've just found the following from the BobTerm documentation. It does use both at the same time! I forgot all about that. BobTerm had it's own XEP80 driver, I believe.

XEP80.BTM

This is a driver for the XEP-80 80 column box from Atari. The driver directs ONLY the term mode screen to both the XEP and the standard term screen. It takes up 256 bytes of buffer space, so you will see your buffer size decrease when it initializes. The driver does not display any menus or the exit window. The XEP is just too slow to keep re-drawing the term mode screen and help screens, and does not have the capability of scrolling in one window and not in another. This is unfortunate.

In any event, you will need two monitors <or a switch for your monitor> to see the term mode screen on the XEP, and the help/editing screens on your computer's output. The XEP driver will update both screen simultaneously, without blanking the computer's screen. Have your XEP-80 plugged into joystick port #2!

Hi folks. I've been using a 1200xl for quite some time now with only 1 problem. I get random inverse video characters running Textpro. They are the correct character, but inverse, and more inverse than not in Textpro. I only see the problem in Textpro, any version. From 1.2 up to 5. I just chalked it up to a problem with Textpro. I've purchased another 1200xl and it display characters in Textpro just fine.

Otherwise, the machine is fine, and I havent noticed any problem with hundreds of other programs. It's just bugging me. Anyone hear of anything like this?

Charlie

>
> Thanks!
> Jack
Uhm..... OK. Lemme guess. You have a file on a floppy and want to
copy it to tape (410 or 1010).

How about:

```
10 CLOSE #1
20 OPEN #1,4,0,"D1:FILE.EXT"
30 CLOSE #2
40 OPEN #2,8,128,"C:"
50 TRAP 100
60 GET #1,X
70 PUT #2,X
80 GOTO 60
100 TRAP 40000
110 CLOSE #1:CLOSE #2:END
```

I think the 128 in line 40 gets you short Inter reg gaps.

OR, you can use DOS copy command (2/2.5/MyDOS)
Hit the COPY command (C ?).
From FILE.EXT to C:

OR Maybe SpartaDOS COPY command
COPY D:FILE.EXT,C:

OR I don't understand what you're trying to do (most likely.)

Try replacing RAM chips. If it is RAM, you probably only have one bad.
If it were me I would do it one chip at a time and reboot the computer
to check.

6498. Re: files to tape

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-30 17:42:44 UTC
From: Jack Tseng <tseng4@hotmail.com>
Message-ID: <pG65g.38660$_z2.25124@dukeread02>
Source record: 6955

it is binary.. not text file or basic files.. sorry for giving not enough information.

I want to copy the binary file to the tape. MyDOS has a tape copier support, I copied the binary file, preppie.exe to the tape. preppie from tape wont boot. It keeps saying Boot Error. Why?

I had an Atari 400 with 410 in the past. My friend had 800 and 810. He had an 1983 Starbowl Football game boot disk without DOS. I did not have 810. so he could make a copy of game on the tape for me. Game can boot from tape. How do I do that?

Later I finally got Atari 800XL/1050, I want to copy the starbowl football game boot from tape back to disk... How do I do that?

Thanks!
Jack...

OK. Well I gave that a go, swapped out all of the RAM chips, same problem.
Thanks for the suggestion though. Any other ideas?

6500. SIO2PC emulate modem for telnet?

Newsgroup: comp.sys.atari.8bit
Date: 2006-04-30 19:39:16 UTC
From: Tom Watt <tom@wattservices.com>
Message-ID: <1146425956.382691.316250@i39g2000cwa.googlegroups.com>
Source record: 6957

Is there software for SIO2PC that will emulate a modem for the Atari?
And then perhaps connect the virtual modem to Telnet (TCP/IP)?

I'd like to use Atari term or BBS software and make it use telnet on
the internet.

Thanks,

Tom

Maybe swap the keyboards? You might have an intermittent inverse video key.

Well the keyboard, other this program, performs just fine. I can turn the
inverse video on and off at will in other programs. But, I tried swapping
they keyboards anyway, no luck. The problem 1200xl has had the RF shield
removed, so someones been in there. No obvious mods though. Oh I hope
swapping RAM chips with an 800XL is ok, thats what I did, all seems well.
Hehe. How about POKEY? Can that be swapped with an 800XL POKEY?

Charlie

Well I swapped POKEY, no change. Well no matter, it's just one program. I
can deal without it, I really dont even use Textpro, it just bugs me
though. I noted the above the RF shield had been removed, it's still
there, just not riveted. I figured someone might take that wrong. Well
thanks for the help.

OK, I see what you're trying.
There are some utilities that do what you want, but don't
often (or often don't) work, ... because a binary disk load
file probably loads in several segments, and even execution
of the .exe/obj/com file is transferred to the loading file
on the run. So, you probably can't do what you want.
You could study the file and see exactly how it loads and
do a tape conversion, maybe, not likely.
Going the other way, copying your boot tape to a exe/obj/com
disk file isn't straight forward either.
Probably can be done, probably has been done, which brings
up the question, why not just get what you want from ftp
site? Just about everything A8 has been fixed as load file
or boot disk.
Regards,
Russg

I have been using the chips from an 800XL for RAM and POKEY swaps. The 1200XL that works OK with Textpro has the RF shield riveted, and I don't want to remove it, might as well leave it factory.

One thing I've discovered today though is that I have 28-pin OS ROM sockets installed already at U12 & U13, cool. I'm looking at the 1200XL PBI upgrade, and the first thing he does in put in an 800XL OS. Would a 600XL OS ROM and MMU work as well here? I'd rather tear a 600XL apart than an 800XL, is all.

Thanks,
Charlie

I think I only visited twice, probably as a guest, and didn't contribute any content. However, for those two moments it was fun to relive what was a large part of my 80's.

I'm currently feeling a period of Atari nostalgia but unfortunately BBSing was low on the priority list, sorry.

Forums filled the void left by the demise of the BBSes. I guess it was too late to go back.

In any case, thanks for offering the service.

I appreciate that. Keep in mind if there is ever a resurgance of Atari BBS's I will consider putting it back up. Right now 1 or 2 8bit BBS's just seems a bit weak. One would expect the remaining few BBS's to be just slammed with activity.

Commodore 64 and Amiga based BBS's are still going pretty well.
Nothing like the old days, but when I ran The Warpzone I often got
several calls per day. Atari just doesn't seem to be as popular for
BBS systems, but they do exist. BBS's are one of my favorite things of
the old days, I am working a project for Commodore and now Atari as
well that kind of merges the old and new of BBS's and Internet.

Take a look at www.petscii.com. Look at the BBS Listings, you'll see
there are several BBS's, and several do have regular activinty.

Thanks,

Tom

Actually I continued to use BBSes until the early-mid 90's but that was a large RBBS or TBBS system and I never once chatted with the SYSOP. The experience just wasn't the same as in the AMIS and Nitelite days on the Atari.

I never owned any Commodore systems (nor Atari ST/TT systems) so I have no experiences and therefore no fond memories. There's nothing to re-live there, not for me.

I can't say I'm slammed with activity, but we're doing alright. There are
good days (10-15 calls) and bad days (less than 3) of course, but we're
averaging 5-6 calls a day.

I'm happy with that.

Hey Tom. My BBS seems to be doing okay. Probably not as good as the Amiga
ones, with their larger surviving user base, but I'm happy with the
results I've seen since re-opening via telnet.

Besides that, its just too darned fun being a sysop! :-)

It's not your inverse video key - try the function keys. Select does this. Probably a sticky Select key - you need to insert printing commands using Select into the text with Textpro. I used it a lot and I got it to do some funky things. ^_^

"I want to transfer a file to tape. DOS does not allow me to do that. The cassette copier does not support the file to tape, only copy boot disk to tape. I struggled that! So how?"

I have some copying programs that I used to copy all readable programs to disk. What it sounds like you need is something that copies a boot tape to a binary loading disk file. There are programs that do exactly this - I did it with the famous Frogger! cassette boot, and fixed it so it would work from disk as well.

If it's BASIC, it's an easy task of loading from tape and saving to disk. Text files - just load from C: and then save to disk using a word processor.

Unfortunately my Atari 8-bit system is not set up at the moment, but the disk with the boot tape to disk file copying program is one of my faves and I have it safe somewhere.

later!

"OK I have to admit I was impressed by "16 colors with 16 intensities" and I knew that 320x192 was monochrome. But what I didn't know is that 16 colors was in 80x192. How does anyone even consider this to be a usable mode?"

I've seen games done in Graphics 9, which is the mode you're talking about. It's also a great mode for use with digitally captured images - looks pretty darn good with ComputerEyes, or grayscale viewing of converted JPGs or GIFs. One thing I've seen is people using Graphics 9 interlaced with Graphics 10, which is 16 colors 1 intensity if I remember right - to produce 256 colors on one screen if seen right. I think people have tweaked the chips with programming to produce 25,000+ color modes. I've got demos that show this is possible.

"I know a lot of Commodore 64 games are programmed in 2 pixel dots because you can only have 2 different colors in a 2x2 area (4 pixels). But otherwise it's 320x200 at 16 colors. Also text is 40x25 with 16 colors. What I found the MOST shocking is that there is no 16 color text mode. This is MIND BOGGLING."

There are alternate ANTIC modes that do color text, but what's great about it, is depending on the mapping of the bits in the text, you can pull off some 4 color text tricks. Just depends on what you want to do - colorized text or easily and quickly mapped graphics for games.

And if you knew how to manipulate the display list.. and vertical blank display list interrupts... ^.^

"I can solve most 1050 faults, but this drive has me beaten so far, speed fine, reads perfectly, but will not format or write, I have changed the drive mech for a known good drive, checked all connections, replaced U13 with a known good chip, and even added a write protect, enable override switch, and still it will not write to a blank disk or complete a format. Anyone got any idea where to look next ?"

Do you have any Sams computerfacts service manuals for it? It could be in the circuitry that controls writing to a disk. The read section is likely in a different area, which is working. I remember a little 8 pin IC in an Apple drive that blew once in an old system and I was able to replace it exactly and it worked again. Check your ICs to make sure none have blown, even the little ones.

Make sure the RPM is correct. Never hurts to check it. (288 or thereabouts)

Also clean the head. ^_^

later!

I am sorry to hear about that. I visit Atari BBS's from time to time. The only reason I do not do it as often as I used to is because I just keep forgetting they are out there. A sign of the times I guess.

For Christmas in the early 90's my wife got me fifty shares of Atari stock. It is signed by two of the Tramiel brothers. I never turned it in when Atari sold out. I guess I figured it would be a valuable piece of history some day.

6523. Serial<->Telnet via Emulator?

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-02 04:01:35 UTC
From: Tom Watt <tom@wattservices.com>
Message-ID: <1146542494.890257.12390@j73g2000cwa.googlegroups.com>
Source record: 6978

Is there an Atari emulator for Windows or Linux that will emulate a serial port and allow the connection to work with Telnet? I know APE does this with a real Atari and SIO2PC. But can any of the emulators do it also?

Thanks,

Tom

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Thanks but like I said I already swapped keyboards with a different 1200XL (which does not exhibit the problem), and had the same problem.

Well I went ahead with OS upgrade. I put in a 600XL OS ROM. I did not put in the BASIC chip. Still seeing the problem! So it's not the keyboard, it's not the RAM, it's not POKEY, and it's not the OS. Well I'm through messing with the innards for now, besides trying to wire in a BASIC chip tonight. Thanks to everyone..

Charlie

I'm no Atari expert - I just got into it less then a month ago!

But, am a long time 8 bit fan and can tell you that it is very common to have versions never released from computers of that time. May be the case here.

Dos 1.0 definately exists. It's not a great dos though, takes up more ram because there is no "dup.sys" like in dos 2 that loads when you need it. I think "house of usher" or one of those games has dos 1 on it albeit with a hack in it to hide the directory sector which could be reversed if needed.

Greetings everyone!

Here are the lucky, the few, the proud winners of this months prizes at The DarkForce! BBS:

April 2006
1. Magic Phrazes - Slor wins the $25.00 prize
2. ST Magazine - Sthelier wins the free 3 mag. subscription

Congratulations to our winners!

Also, here are next months prizes:

May 2006
1. Final Frontier II - one lucky winner, or *team* will win the $25.00 prize. Team members will divide up winnings. If the game goes into more than one month, that months prize money will be included. As sysop, I will be playing, but am exempt from winning, or joining any team.
2. ST Magazine - some lucky Atari caller will win a free 3 mag. subscription.

Good luck to all! :-)

Well compared to the value of Atari per share stock price, it is :)
But I picked up 500 shares for myself and 140 for my son. I am hoping
they start moving on up :)

Edward, hope to see you at MGC and VGS.

6536. Configuring an XF551

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-03 13:19:24 UTC
From: Larry <LLppwhite@earthlink.net>
Message-ID: <1146662364.657291.320120@g10g2000cwb.googlegroups.com>
Source record: 6993

I have a modified 1050 drive that allows me to select it as D1: or D2:
using a SPDT (IIRC) switch mounted on the *front* of the drive. A very
useful mod. I wonder if anyone has seen a similar mod for the XF551?
I'm sure that I can transpose it if need be, but if someone has already
done it, that will save some trial/error. Thanks. -Larry

6537. Re: Configuring an XF551

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-03 15:48:18 UTC

Message-ID: <1146671298.053844.55700@g10g2000cwb.googlegroups.com>
Source record: 6995

Had to open up the drive for something else, so I got out the meter and
did the mod. For just one selection (D1: or D2:), only needs a SPST.
Handy for use with MyIDE, which doesn't allow for true drive swapping
at this point (as with BB and MIO). -Larry

6538. Free 1mbit flash cart!

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-03 15:49:36 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.05.03.15.49.36.709792@charter.net>
Source record: 6994

Folks, Steve Tucker, of APE fame has graciously offered to
donate a 1 mbit flash cart for the monthly prize giveaway
at The DarkForce! BBS.

So this month, just for you 8bitters - we are giving away
said cart!

Remember, it only takes 1 call each month to qualify, but
the more times you call, the more chances you have to
win.

We use a small program called "winner" that randomly
picks a name from the list of callers each month...

Good luck to all! :)

Hi,
If you can tell us what the N function of the menu is for and how to use it?
Define device... I booted the ATR but, no documentation. I can imagine
that it is for any add-on that would need a driver to open. Good luck and
have fun with it. I was going to respond to your query, but a previous
correct response was posted.

> Define device... I booted the ATR but, no documentation. I can imagine
> that it is for any add-on that would need a driver to open.

No add-on needed, it sorta works right away. So what does this do?

This function creates a "device alias" that reaches a specific device,
or file under a different name. For example, you could create an F: device
handler that redirects all its outputs to D:FOO.DAT by typing

D:FOO.DAT,F:

or you could create an alias for the editor such that all data that goes
to H: goes to E:

H:,E:

However, this function is in several ways pretty much broken:

o) Any file name appended to the new device alias is just lost. That is,
you cannot create a device alias F: for D: and hope that F:OUT.DAT goes
to D:OUT.DAT. Instead, it will go into whatever file name you defined for
the device alias. And if no file name given, then the DOS will just error.

o) It works only for OsA or OsB. This is because this function creates a
new entry in HATABS which jumps directly (eerk!) into absolute ROM addresses
that plain wrong for the XL Os.

o) It does not provide any specific Device-special commands. Any attempt
to rename a file on a device alias, or perform anything more spectacular
than just open the stream and then read/write to it will crash the system.
This is because the handler entry created for the device alias does not
hold an entry for the "Special" routine of the device, it just points to
address 0. Any attempt to jump there by a special command will then likely
crash the system.

In other words, probably a nice idea, but pretty useless in practice, and
a completely broken implementation. Not a miss.

So long,
Thomas

Yikes! That's one expensive BBS you're running there. The cash prizes
alone are an outlay of $300 per year. I don't know what the magazine
subscriptions cost, but running the DarkForce BBS is certainly not cheap.

This may seem like a dumb question, but I assure you it is not. I don't own an Atari XF551 disk drive, but I do have three Atari 1050 drives. I know how to select the drive ID on the 1050 drives -- two little switches at the rear of the drive -- but I'm curious as to how ID selection is done on the XF551 drives. Is it not the same? Or is it more involved than sticking a pointy object into a little hole and sliding one or two switches?

I used to use BBSes until about 1995 as well. Internet didn't reach our neck of the woods until about 1994 or 1995, so the BBSes were the bread and butter of the local perverts and software pirates.

It was always my desire to operate my own local BBS, but the emergence of the Internet pretty much killed off that idea. Shame too, as I had collected a whole pile of files to offer on my BBS -- files that I hadn't the hardware or the interest to use.

Played with a bunch of BBS software while working toward my fantasy BBS. Everything from AMIS, Carina, BBS Express, and FoReM for the Atari 8-bit, to Public Address, Mansion, Pancake, and one other whose name I don't recall, for the Macintosh.

Ah well, all's well that ends well... And on that note, I'll end this post.

I'm curious about your TRAP statements. Clearly, your little basic program
is going open the disk file for read and then open the cassette for a
write. You then set a TRAP to line 100, in anticipation of an EOF error.
What I don't understand, is why you set your TRAP to line 100, when line
100 is just another TRAP to 40000. Could you explain that for me?

Ronald Hall:

Any relation to Rich Hall?

I distinctly remember watching a television program as a kid titled, "Not Necessarily The News." Rich Hall was a cast member and/or writer on that program. It was quite funny actually.

"They were young... They were in love... They needed glasses..."

Another bit that I vaguely recall was one in which a man glowed about his wife, and her favourite hobby: drilling for cobalt.

Anyway, to each their own, I suppose.

TRAP 40000 turns the TRAPs off. Always a good idea,
as the trap stays there even if you're out of the program.
Also it is good to CLOSE whatever channels you opened
as some versions of Sparta/FTeDOS will trash a hard drive
if chanels are left open. Just good practice to turn off
TRAPs and channels.

I must say, I did not know that. I knew about closing the channels, but I was ignorant of the necessity for trap cessation. Although, to my credit, I can honestly say that I've never encountered a problem with persistent traps.

When I used to code in Atari Basic many moons ago, I would use traps quite frequently as a means of branching my software. I found that I could get my software to perform a little more quickly by creating errors as opposed to testing for conditions. It's my warped spider logic, I suppose.

Atari Basic is really quite basic. If you have experience with Commodore Basic, there's not much extra that you need to learn. A simple Atari Basic reference manual or brochure should do quite nicely.

When I switched from the Commodore computers at school, to the Atari 8-bit, my biggest obstacle was figuring out how to load software from a floppy diskette. LOAD"SOME PROGRAM",8 just wouldn't work on the old Atari computers. Then somebody mentioned a funny sounding word that rhymed with loss, and I haven't looked back at a Commodore computer since.

I fell in love with Atari DOS at first usage. Although, with some humility, I will admit that my first experience with Atari DOS was DOS 3.0. Hey, I was new to the machine, what can I tell ya?

Anyway, as time marched on, I saddled up with DOS 2.0 and DOS 2.5. Eventually, SmartDOS became my favourite, before it was replaced with SpartaDOS. Most of my hundreds of 5.25" floppies are still formatted with SmartDOS however.

To get back on topic, I didn't have any great difficulty in learning Atari Basic. I had already known the basics from coding Commodore machines at school. There were some syntax differences that I needed to adjust to, but that was really no problem at all.

Probably my best resource in learning to code in Atari Basic, were the old Antic, Analog, and Compute! magazines. I remember spending hours, days, even weeks, typing in printed code listings from old computer magazines. Many times a lightbulb would glow over my head as I muttered to myself, "So that's how you do that!"

I'm not sure about the persistence of TRAPs. I think if you
exit a BASIC program that has TRAP set, and do an error
in immediate mode, say RUN "D:wrongfilename.ext" you
could be executed back into the program, I think.
The other reason is that TRAPs can make things a lot harder
to follow. If you put a TRAP 40000 where the TRAP you
set is supposed to go, you know what happened where, whereas
if you don't turn off the TRAP, you might have a tough time
figuring the error that occurred. You could even put a
? "Trapped from line XXX" after a TRAP 40000.

There's a memory location that you can query with a peek statement to get
the error code. I don't recall precisely what it was, as it was a long
time ago that I programmed the Atari 8-bit.

If you comment your code sufficiently enough, you shouldn't have any trouble
following the code. Although you probably wouldn't want your code to be
too large on a machine with only 48k or 64k on average. But then, if
you're writing software where code size and speed are going to be an issue,
you probably wouldn't be using Basic.

I do see your point however. Although I can't say that I've ever
experienced the former. Usually when the basic program stops executing --
i.e. an END statement is encountered -- the program is done. You could
always have the code clear itself from memory on halt as well.

What do you mean by that? There are several programs that allow you to
swap your MyIDE drives around (not physical drives of course, maybe that is
what you mean?)

6564. ATASCII viewer for windows

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-07 12:56:17 UTC
From: lee <leehanken@gmail.com>
Message-ID: <1147006577.212843.230790@j33g2000cwa.googlegroups.com>
Source record: 6921

Hello All,

Letting you know that I have just released a new version of the Windows
Atari text viewer ATASCIIView.

This is freeware.

It can handle both windows and atari text files. This version has been
re-written with scrolling, print-preview and printing.

Feedback is welcomed.

You can download ATASCIIView from:

http://www.leehanken.pwp.blueyonder.co.uk/atari/ATASCIIView.zip

Comments can be sent by email or via

http://www.leehanken.pwp.blueyonder.co.uk/zisp/mailer

Regards,

Lee

Love it!

Is there any possibility of incorporating Mark L. Simonson's (<-error corrected, sorry) Mac/Atari Fusion Truetype fonts (see link) into your program?

These are wonderful fonts (IMO) but until now I haven't seen any PC applications that could utilize the full 8-bit ATASCII character set.

Link
http://www2.bitstream.net/~marksim/atarimac/fonts.html

That is very nice and I wish I could afford the postage to the UK. The package includes Zebra Systems Spectrum emulator cartridge I notice. That looks like a Melbourne House book under the TS2068 manual and the blue book under that looks interesting too.
I don't suppose that you have the ZX Programmer's Companion or the ZX80 Assembly Listing and other such books?.

Cheers,

Geoff.

Assuming you have a version of DOS on an ATR loaded...

The command(s) would be as follows.

Untokenized (bloated, plain text) save file: LIST"D:FILENAME.EXT"

Tokenized (considerably smaller): SAVE"D:FILENAME.EXT"

To load an untokenized file: ENTER"D: etc. etc...

For tokenized files: LOAD blah blah blah...

So you accept USPS money orders from those who are not scamming morons?

The problem is that it is you who are acting like a scammer. Firstly,
you don't use eBay -- the standard way to sell such things. Then you
post about your fear of being scammed, when a moment's thought would
show that the seller is never in danger of being scammed -- simply
delay shipment until the check/MO.CC/etc. clears. It is the buyer who
is in danger of being scammed; he has to send money before recieving
anything from this anonymous[1] person posting on a newsgroup. Make that
LOTS of newsgroups...

AFAIK, you can't configure the MyIDE for an SIO Floppy which is physically configured as D1: to respond as D2: or any other drive (2-9). The MyIDE of course has the feature of "boot from Dx:" as part of FDISK. With the BB and the MIO, you can go to the configuration menu in the Rom and swap drives with abandon.

If there is a way to do this with the MyIDE, I'd appreciate knowing.

What's even more odd is that the OP posted to comp.sys.apple2, but doesn't
have any Apple IIs to sell. (Besides, even if he did, a hypothetical
on-topic message would get posted to comp.sys.apple2.marketplace anyway.)

Paul,

You will need to create and format a disk image in another virtual
drive.

SAVE "Dx:FILENAME.BAS" where x is the drive number where the new image
is located and FILENAME.BAS is the name you wish to call it.

Rory

Cheques never really "clear" in the way that you mean (that the receipt
of the money is guaranteed). It's quite possible to pay a cheque into a
bank account, have it "clear" after the usual 3-5 working-day processs,
and then have it subsequently declared "fraudulent" days or weeks down
the line. DAMHIK,IJK,OK?

be VERY leery buying from this guy. His attitude and 'self protection'
is extreme and opens you up to getting screwed rather easily. Especially
being overseas.

Find a more honest and calm headed seller on ebay. That way you can get
your $ back from paypal when he stiffs you, which i suspect will be the
case here.

Ah, I understand now. No, there is no way to do this currently. That is
something that Mr.Atari would have to add to the OS SIO function. He'd
have to query some sort of translation table, and I know that space is at a
premium in the ROM.

I don't even have my physical drive hooked up anymore, so I've never run
into this as a problem.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hi,

> I am running an emulator and I'd like to throw together a quick little
> basic program. I remember most of the commands but there's one thing I
> have a question about. How do I save my program while running it thru
> Xformer or Atari800Win??

I can't speak for other emulators, but for Atari++ the most convenient
mechanism is to save and load the files from the host filing system
using the H: device (if enabled). Thus,

SAVE "H:MYPROG.BAS"

will write it into the directory linked to the H1: device (see the menu),
and

LOAD "H:MYPROG.BAS"

will restore it.

To see what's in H:, either use the file browser of your host system
(i.e. KDE/Gnome or - shudder - windows), or go to the DOS menu via

DOS

then type:

DIR H:

to get a list of files in there. To return to Basic, press the
emulated reset key (F6) or type

CAR

So long,
Thomas

6590. Is Welfare Part of Capitalism?

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-09 08:58:30 UTC
From: destroyallenvy@yahoo.com
Message-ID: <1147165110.429247.321370@e56g2000cwe.googlegroups.com>

This article is dedicated to:

A man I met, with most of his body heavily burned, simply because he
was a Chinese during the 1998 May Riot in Indonesia.
Lots of capitalists that are slaughtered during the cultural evolution.
Ten thousands of peaceful smugglers that are massacred in Banda island
by the Dutch for conducting peaceful spice trade and all that are
similar to them.
All minority groups and individuals that face discrimination, even
genocide, for economically contributing too much for their society.
All customers that have to pay higher products due to protection of
tariff and trades.
Productive people that are fined with income tax for the victimless
crime of making honest money.
Smart students that are slowed down so not to move too fast.
Industries that do not get subsidy, or even banned to protect
unproductive industry and laborers that earn much less due to such
restrictions.
Poor starving people that could have been rich had their countries
choose to embrace free market.
Women and males that are trapped in unhappy marriage which they have a
hard time getting out.
Women and children that have lots of their best choices taken under the
pretext of protection.
Immigrants and refuges.
Is welfare part of capitalism?

In short, no. In consensually, punishing the productive through income
tax to reward parasitic behavior is the biggest affront against the
principle of free market. In fact, from many governments intervention
in economy, the one that proponents of free market often oppose the
most is welfare.

However, when we look further, capitalism and welfare is not really
total opposites. Most importantly, properly done, a straight forward
welfare program can cause less market distortion, and hence an
efficient replacement to buy votes from losers, than farm subsidies,
public schools, minimum wage, trades restrictions, tariffs, and sex
laws. If it's done by taxing wealth, rather than income, the amount of
market distortion can be minimized further.

Welfare is also cheap. It'll cost $5000/year to a welfare recipient
in USA, for example. However, we need to remember that the
recipients' lifestyle worth only $500. The other $4500 goes to
implicit welfare due to higher living costs. That implicit welfare

includes minimum wage, immigrations laws, and food subsidy, or protections.

If somehow a straight forward explicit welfare program can replace all relatively more evil governments' interventions, then capitalists are probably better of not opposing welfare so much. Even Milton Friedman supports schemes called guaranteed minimum income, which is like welfare but with much less market distortion.

That's not where the similarity ends. One of the main creeds of capitalism is that consent and competition should be preferred over force. Without that consent, anyone can simply make us choose to make our self worst of under the pretext that it is for our own good. In fact, most laws against consensual acts can be traced down to protection of some disgruntled competitors often done under the pretext of the consenting parties' own good.

Anti prostitution and anti polygamy laws, for example, is there to ration females to poor dumb males under the pretext of protecting the consenting women. Of course, all natural resources tend to be rationed somewhat proportional to ones' voting power. And that does explain why democracy and anti polygamy laws go hand in hand too. One man one vote soon leads to one man one wife.

Well, at least Matt Ridley agrees with me and he's a well known mainstream scientific researchers. I guess that's also why so many uncompetitive people want to ensure that evolution theory is not taught in school. You can also read a famous psikiatrist book, "The road less traveled," you'll see that life long monogamous marriage is just a trap to prevent highly desirable people from being available to those who they want more, and romance is just the lure to that trap.

On the women side, anti pornography laws is really meant to prevent highly desirable women from advertising her assets and hence protecting less pretty women from the higher industry standard a public display of superior desirability might cause. Countries that embrace porn tend to have prettier women. Where did all the unsexy ones go? They're all shifting out of the gene pool, and hence are doing their best to oppose porn preaching religious doctrines that men should judge women based on any features but beauty, which they can't offer.

Another issue is consent. Welfare program is not consensual; however, it's relatively more consensual then civil war. In ancient time, when we have different ideological opinions, we end up killing each other to proof who are "right." The Catholic would kill the Gnostic, the Sunni would kill the Shiah. One King would kill the other. A younger prince will argue that the older prince is demon. Might makes right.

Such differences of opinions are of course solved with war, which is a very cost inefficient way to know who're "right." However it does work in some subjective practical sense. If we look in the past and try to figure out whether the Gnostic or the Catholic is the one that's

heretical or "right" respectively, we need only to see who won. The Gnostics are slaughtered, so they must be the heretic, or do they? At least I bet there are way more people in the world that think that way than the other way around, excluding me actually.

It doesn't matter how many books many institutionalized religions burned, how much restrictions of freedom of speech and irrationality they embraced, how many witnesses they snuffed outs and all other techniques that would not have stand the scrutiny of a peer reviewed scientific journal, or even a reasonable jury in the court of law. Too many people don't believe who are right and reasonable, they believe who are mighty. Right or wrong, the win will always become right anyway.

Now, under democratic context, we don't kill those who oppose us, rather we try to persuade enough people to join our cause. How do we persuade them? By money of course. Welfare program is then a reasonably cost efficient method to buy votes.

When too many people are on a side, we will sort of know that going to war will hurt the other side; hence we comply anyway with the whim of majority avoiding the costly alternatives. While not ideal, this is indeed how right and wrong is really decided, proper assessments of each sides' bargaining position and mutually cherished compromised line of war, plus a bunch of lies covering what's going on to safe each sides' face.

No matter how noble the purpose, lies and prejudices lead to misunderstanding, that leads to more war. Hence, the best contribution is simply to unmask all lies.

All in all, peaceful democracy is indeed a more cost efficient ways to measure ones' bargaining position. While democracy often lead to decisions opposites of freedom, like popularly supported victimless crime, income tax, and welfare, it's indeed relatively more cost efficient than civil war.

That's not when the coherency end. Various natural laws restrict various possible political outcomes. We can't expect a stone will fly to the sky when we drop it as much as we cannot expect a human to be generally unselfish. If we want to kill our enemies, we'll do well dropping a big stone on top of our enemies head rather than dropping the stone on top of our own head expecting the stone to somewhat magically fly to the enemies head.

The same way, we can't demand market distortion and expect that the best and brightest among us to still magically be a nice tax payer rather than dictators and corruptors. In a country where selling porn or building a good franchise chain is more difficult and less lucrative than becoming a dictator, guess what the smart would end up doing? Ask Saddam.

If we want rich and prosperous countries, we must know that it will and only will happen when we properly align individuals' interests with productivity.

Such coherency tends to make certain things come in package with another. We can expect that moving electric field will induce magnetic field. The same way, in life, we observe similar things. Communism and socialism, for example, always come in package with dictatorship and corruptions when smart people realize that being dictators pay more than building a business empire.

To the opposite capitalistic countries comes in package with softer deals for losers, such as, guess what, welfare.

We know from our economic classes that free market capitalism brings prosperity within market mechanism. However, it turns out that the prosperity that free market brings also profit the less successful beyond market mechanism. Capitalism and the prosperity that come with it tend to facilitate ideological changes in ways that benefit the less successful. One such ideological change is the popular support for losers' benefits. One such benefit is, guess what, welfare.

The most obvious samples of such ideological shifts the free market bring are the elimination of slavery in US. What happened? As usual, the northern part of America is an industrial country. At that time, steel industries are relatively more modern than the farming industry. Higher tech industry increase labors' productivity. When labor's productivity goes up, entrepreneurs will want to hire as many workers as possible. Hence, labors' salary will go up. This will kill of industries with less labor's productivity. At the end, the marginal productivity of labors in the least productive industry will go up. That value is labors' salary.

Under competitive equilibrium, the more productive and efficient a person is, the more he benefits everyone in the chain of productivity except those similar to him. Hence, an entrepreneurs coming up with ways to improve labors' productivity would benefit everyone, including workers and consumers, at the expense of other entrepreneurs and capitalists. Read that Karl Marx!

Then what? When labors' salary goes up, obviously labors will move to the employers that pay them higher. Hence, farm labors in the south want to move to the north. They can't do so legally though because they were slaves. Hence, the northern capitalists in US want to free slaves so they can hire more workers. And then the southern capitalists in US want to keep slavery. This then results in war. The bigger the labors' productivity, the more intensive capitalists have to free slaves. The more supporters there will be on a cause the more likely the cause won. Hence, slaves were freed.

Unfortunately, people still want to help losers and buy votes from those who are too expensive and too stubborn to switch. That explains why the farms in US gets subsidy.

If losing means not as successful as the other, then there will always be losers. However, we see how free market shifts the worlds' system in ways that benefits the losers too. Unlike the commies' propaganda, capitalism does not cause or even enlarge disparity of wealth. Capitalism only changes the way such disparity are earned to the benefits of all.

At the end of the warring states period in China, the king of Chin, Shih Huang Ti, and his prime minister, Li Si were the winner. Within one generation they have all their family slaughtered. If that's what winning means, what did losing means in pre-capitalistic countries? In ancient time, losing meant having all the males slaughtered, enslaved, or castrated and all the females raped and winning means risking your whole family slaughtered by rebels. In socialists countries the rich are corruptors and dictators that slice each other throats while the poor are starving.

Now, thanks to the prosperity only free market can bring, losing means they can leave on welfare, with plenty of chance to climb back and proof their worth, like J. K. Rowling. Now, slaves are so free and highly paid thanks to increase in labors' productivity. In fact, when slave jobs are moving to China under globalization, slaves in US refused to be emancipated and want to keep their slave jobs in US rather than evolving into entrepreneurs. So, much for the land of the free and the place of the brave. Some people don't mind dying for what they believe in but are too scared to start a business. Evolutions will fix that I guess.

Free market gives abundances to everyone. The benefits the free market brings benefit those less capable from being successful not only within the system but also through non market mechanism, like the ending of slavery and the start of reverse slavery we call welfare. But how do those really work? Is there a general principle?

Each of us is greedy and selfish that we want as many as possible for us. Humans' greed and selfishness is an undisputable scientific facts, as sure as the sun rise in the east, as sure as a stone will fall to the ground pulled by gravity. We're not just greedy and selfish. Greed and selfishness doesn't explain all the war, suffering, and poverty we face.

In fact, greed is good. Properly aligned, under free market, the greatest among us shall be the one productively providing the best service to the most customers. Blessed be the productive because they'll be rich. This will encourage higher and higher standard of living that we are currently enjoying.

Free market allows those who serve more to grow richer. To those who have more profit, to those more capital are given. Even kingdom of heaven don't mind using this nice positive feedback effect. Who needs new deals to break up companies?

Also, women prefer the rich. The next time you watch soap opera, make sure it's made in some country with the highest IQ in the world, like Hong Kong.

Free sex means richer males will consensually attract and mate with more women producing more kids. That's the whole point of getting rich by the way. Duh?

In fact, that's what being a living human male is all about:

1. Gain control ship of as much money or power as possible.

2. Attract or in anyway acquire as many females as possible.

3. Make kids.

4. Use that kids as tools to make grand children.

You bet it's right because it's science. Of course, they don't teach this important fact in biology class because government interfere in education.

Hence, when we're free, without genocide, without war, even with humanitarians aids given to appease enemies, the meek will indeed inherit the earth.

More than greedy and selfish, some humans are simply not humans because they embrace the root of all evil, envy. That explains why we have so many laws against mutually beneficial consensual acts and governments regulations to protect us from our own choices. The truth is, all those laws and restrictions are more often not there to protect stupid people from making mistakes. All such laws are there to prevent the smart from making the right choices.

That's why, for example, every body has to move equally slowly in school, to prevent the smart from moving faster. That's why various reproductive techniques are politically incorrect proportional to the expected quality of genetic material that will be duplicated. In particular, life long monogamous marriage, free sex, prostitution, polygamy, and cloning are sequences that both have increasingly expected value of genetic quality outcome and politically incorrectness.

In Europe and China, the smart monks are encouraged not to get married. When some minority groups don't buy the bullshit and hence greatly improving their productively earned wealth and genetic quality, such minority groups somehow become victims of genocide.

Life is like a real time strategy games. That means when we're not at war, we're in a race. That's simply how we evolve. Morality, religions, and ideologies, are stuffs created by really smart people to persuade us to run backward.

Peace means we're in a race. Freedom means we are in a competition. Some people just don't want to compete. Hence, they craft lies and

prejudices against those who are in front preventing progress to prosperity.

I'll tell you the scientific truth. It's from the fruit we knows the tree. Anyone opposing free trades and globalization is more evil than Hitler or Nazi. If only Japan and German could have acquired natural resources through consensual peaceful trade, Nazism wouldn't have been popular there and Hitler wouldn't have risen to power. With his mass hypnotic skills, he may have ended up as seminar speaker I guess.

If only those who had wanted to incite the Second World War see all the miracles and prosperity the free market brings, they would have repented and embrace free market. Yet, after all the prosperity and wealth the free market is bringing to all of us, still many people choose to oppose competition, and hence, miss-properly align our interests from productivity. That is the cause of all evil in the world.

All causes opposing free market can be negotiated and appeased. However, if the very thing that a group of people want to prevent is the success of the others, then the situation is pretty much kill or be killed zero sum game.

How does such situation usually end up? What would be our optimum solutions for such situation?

Under normal circumstances, an optimum solution of any business decisions is a solution where the marginal revenue equals to the marginal costs. Hence, in a zero sum game, each party will try to maximize its benefit to that point. Sometimes, the marginal costs have a spike. There is a certain point where increasing a resources allocation beyond a certain point will create adverse costs. For example, increasing the number of labors will increase revenue.

After a certain point, increasing one additional labor will mean buying a new machine or building a new factory. We may end up choosing to do it, we may not. In either case, discretions are the better part of the valor when it comes to that line.

The same way, in most countries, each of us can increase our profits using property we own or consensually rent. When we maximize our profit that way, the public will, ideally and some times truly, not interfere, and defend us from being prevented to enjoy our "rights" by others. However, when we start using others' property to maximize our gain, say by stealing, public opinions may shift from protecting us to against us.

Hence, the choice whether we should steal or not depends on the extra costs of crossing the politically correctness line of war. If a person sees that the potential gain justifies the increase costs of public support shifts, he'll still steal and make a great career out of it. Otherwise he'll stop stealing while coming up with a pretext to

justify his cowardly decisions, such as morality.

But what do the people choose their reaction to a specific act like stealing? They do so based on their sense of fairness, justice, and right-wrong discernment. How do people get that sense? From ideology. The ideology, religions, or whatever, then decides the line of war where the rest of us should consider before crossing. But how does the line gets drawn? By estimates of bargaining position.

Let's examine an example. Is the King (or Queen?) of England the King of France? Don't know. How do we know? In the beginning, a ruling class from France went to England and become king of England. Then they lost control of France. Hence, king of England wanted to take back the controls they have lost. Well, such conflicts are solved by war. In this particular case, the war lasted 100 years.

The British attacked France and successfully route knights with long bows. Then, the Frances stroke back driving the British back to their isolated islands. However, the France cannot move further and go all the way to attack British because of the Strait of Dover separating the two nations. Finally both sides realized that the straits somehow became the sacred line of war. It's not auspicious to cross the line of war for either side. The France, having more army and larger population would beat up the British on land, and the British being stronger at sea can always repulsed France sea invasion. Hence, we got peace.

Such natural separators like straits and mountains explain why Europeans are divided into many different countries. The Chinese, not having that natural line of war, end up getting united all the time.

Now, let's get back to the question whether welfare is part of capitalism. If all of us have just enough food, and some people don't work, what would we end up doing to those who are not productive?

Humans' basic instincts and preferences lead to gene pool survival. When food is scarce, such as when the people demand centralized planning, it would serve ones' gene pool survival to slaughter the parasites rather than sharing food to them. That's because sharing food to those who do not earn it means starving ones own self. In fact, humans will kill each other to literally eat each other when food is scarce. Such is what happened in China and Rusia when centralized planning, governments' intervention in economy, and prejudices against successful capitalists became the norm.

However, when food and money are abundance, such as when the people embrace free market, fighting the parasites might cause more gene pool survival lost than feeding them. On the other hand, simply giving and yielding toward threaten will motivate people to keep pushing us around. Moreover, giving in to those who can use force against us will motivate countries to build arms rather than say, better video games.

Hence, one possible strategy to minimize open war while still properly aligning ones interest with other individuals around them is to give to those who ask nicely and ask less. As free market brings a lot of abundance, those who are needy can be appeased much more cheaply than those who are envy, and hence, we got welfare program.

To be frank, I'd rather see the unproductive people have bigger TV rather than letting them make more kids. It's more humane, and cheaper. Guess what? Most people that know they're not very capable either would rather have that too.

Back to the France vs British. If only both sides have realized the true bargaining positions of each, they wouldn't have to resort to such expensive 100 years war right? The thing is, the 100 years war are the most credible and accurate ways to measure ones' bargaining position. War shows which one is stronger, and hence leads to a mutual understanding of where the line of war might be.

If only we can wave our gun and scare the enemies, it'll be great. However, the only threats that are credible are those actually done.

How do we know a cause's bargaining position? Democracy might give some light by counting the number of those who are in favor or against what we consider lesser evil. However, number counting can be deceiving. We hold this truth with plenty of evidences, that humans are inherently different.

We have difference capability and preferences, and hence different choices and outcome. It's useless to lay net in front of anything with wings. Those who are genetically predestined to be successful will get rich anyway whether through honest capitalistic means or through dictatorship.

Those who are small in numbers can hence be quite strong. Preventing the smart from making money honestly will then turn them into corruptors and dictators. When the Chileans demand to prosecute their entrepreneurs, they end up getting a dictator, the way any country that demand slavery over freedom deserves. Fortunately, Pinochet are relatively benign compared to others dictator and embrace free market giving the miraculous prosperity that the Chilean now enjoy.

Now, US government arrested his daughter for a crime of tax evasion. An act that wouldn't have been a crime if making honest money is free. The miracle of Chili becomes the model of China's moving to free market. It also helps to end communism all over the world peacefully. If capitalists fail to show thanks to Pinochet family, I don't know what would happen to all of us.

So, beyond number counting, the more accurate ways are then through skirmishes. When people cross the public's opinion line of war and we don't strike back, the line of war will shift against the coward by precedence. By fighting back, we'll then have a more accurate knowledge of which one the public would agree with.

Hence, it's very important to retaliate to what others do to us, either good or bad. It's a pleasure to serve my friends, it's also a pleasure to wipe out envy enemies that are on our ways, should my friends wish or don't mind.

When a fraudster tricks my brother over $3,900, my main concern is not to get my money back. My main concern is to get the fraudster to jail even if that will costs far more money than the $3,900. When a thief steals my money on 2001, my concern is also not to get my property back. What's just is to encourage the whole world to post any thieves conviction records on the net to prevent further larcenies.

It makes me wonder though. Why people consider it cruel to damage a thief or a fraudster' reputation? The mere acts of making honest money are punishable by income tax. When Everett O. Lasher makes an argument in court, the case leads to $5000 fine, and understandably, a suicide. The mere acts of successfully fending of ones' home from thieves lead to a life long jail term for Tony Martin. Thousands would march against WTO demanding harsh laws to punish those exercising consensual trades. In Iran, the mere acts of switching religions can lead to death penalty.

In Indonesia, new laws are being drafted giving years in prison for kissing in public. Of course, public rape during May riot are still far from being punished.

This while murderers of Vincent Chin went free without jail term. Thousands would march to end death penalty against murderers. In Indonesia, religious fundamentalists can come to a house and destroy properties from houses providing consensual entertainment with polices watching. Those people often get away or lightly punish.

If consensual productive acts are punished while damaging inconsensual forces are not, soon, all highly productive people would end up in gas chamber after the next Cultural Revolution, or what ever. Those who are left are those smart enough to be dictators enslaving the rest of us.

Prejudices reminds me of an envy old hag that's so determined to ruin my reputation for being friendly to her and her friends, after her own friendly communication. I never intended to fraud anyone or steal her money yet I got my reputation ruined. I am very disappointed to see that there are people in the world that want to bring me down more than they want to bring down a thief.

I have tried to resolve the issue privately by suggesting to that thing that she's really not important enough for anyone to pretend to be her friend. Moreover, I didn't need her as a friend. All this was just a damage-less misunderstanding caused by her own friendly communication which I could simply publicly straighten out. At least, it used to be.

However, that vermin really wished to get the issue public telling lies that she never communicated with me, possibly to boost that things' feeling of importance her genes deny her. Well, if she got so mad over a few friendly introductions, I can only wonder what that thing would

do when it finds out that her true envy natures are revealed to 55000 newsgroups several times. It'll happen again and again whenever I feel like.

Hence, just look for "envy vermin" on the net to find out what's really going on including what she said privatedly. Let the public decide who are more honest, rational, scientific, and straightforward. Let the market decides which one are worthy and who are worthless. It's a great mistake to ever consider such thing as a friend, a mistake no body should do. It's her kind that turns people of from making money productively.

Hopefully we can undermine public opinions against all form of envy motivated lies and prejudices. At the end, we'll greatly weaken laws against victimless crime and easily out compete all envy people out of the gene pool. That'll ensure that the free fair market competition would reign over war when all lies and prejudices against those more successful are gone.

Now that being said, I want to move all jobs that can be done online to Asia, especially, copy writers. Take advantage of the value difference and leverage like hell is how we all make money in any system. Who's with me?

Free market is all merciful and all compassionate. At the end, even those that oppose free market will benefits from free trades.

6591. Bad POKEY?

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-09 13:13:01 UTC
From: Larry <LLppwhite@earthlink.net>
Message-ID: <1147180381.328537.99350@j73g2000cwa.googlegroups.com>
Source record: 6848

I suspect that I have a 130XE with a bad POKEY chip. If I attach only one drive, the drive will respond properly at regular or "3X" speed. If I attach two drives, they respond properly at 1X, and give frequent error 160 at 3X. Other XE's work perfectly with several drives attached at regular and hi-speed. Weak POKEY?

Is there any diagnostic program that can test the POKEY a little more definitively before I attempt (shudder) desoldering? Something I'm still not too good at. Thanks, Larry

Assuming the POKEY is faulty:

My recommendation is that you use a sharp tool to cut the pins of
the faulty POKEY, then you de-solder one pin at a time. After that
you solder a socket where the old POKEY was, and insert a new
POKEY there. By doing it this way, you will most likely not
damage the circuit board while trying to remove the old POKEY
chip.

Anders

Probably also a weak cable. Might be worth to try another one first.

So long,
Thomas

Hi Anders and Thomas-

Thanks for the suggestions. Yes, clipping the "legs" individually is a very good idea -- I'll do that. I've actually found a pretty good tool for that -- toenail trimmers -- the kind that look like miniature side-cut (pliers)! Tried swapping the cable first, but unfortunately made no difference. -Larry

Don't forget that the PIA also plays a part in SIO communications, you should have 68B21 for a PIA chip. Particular attention should be paid to L10 (inductor on the +5 Ready line) which on the 1200XL can cause the SIO to not function at all until it is bypassed with an intentional short across it. Further the XE has added capacitors to the SIO lines (of note - 1, 2, 3, and 5) which may be best left out of the circuit all together. C301, C302, C303, and C304 in particular could have one leg lifted to see if that made a difference before you attempted a 40 pin chip swap out. This 'gang of four' is located on the right side and just below the SIO jack on recent motherboards, it's best to lift or cut the south legs of these. They all add additional loads to POKEY's SIO clock and data I/O lines above and beyond the XL's C75, C76, C77, and C78 capacitors which the XE also has. So the XE is double whammied in that aspect. For some reason C300 series capacitors on some XE's have them all as one twisted 'bundle' sharing pin holes with the SIO jack itself. If that is yours, I would just clip them all off and try it before tackling the bigger 'fix'.

6599. How did BASIC-XL's FAST work?

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-10 15:55:23 UTC
From: Will Hartung <redrocks@sbcglobal.net>
Message-ID: <L1o8g.70406$F_3.39402@newssvr29.news.prodigy.net>
Source record: 6856

Talk about arcane ATARI trivia and minutae, I have a oddball question.

If anyone may recall, BASIC-XL had this novel FAST command that you would put at the beginning of your programs.

In normal ATARI BASIC, when you did somethng like "GOTO 100", the interpreter would start at the beginning of the program and then scan for, in this case, line 100 so it could do the GOTO.

When you did a GOTO to a line that was farther down the program, that GOTO would take longer than to a line that was toward the beginning of the program.

This scanning happened for GOTO, GOSUB and also FOR-NEXT loops. So, at the beginning of a program, a line like: FOR I = 1 to 10: A = A + I: NEXT I would run faster than the same line at the end of the program.

BASIC-XL, however, had a FAST command that when encountered, it would run through the program once and essentially "pre-compute" all of the GOTO's etc, and the programs ran MUCH faster. Telengard, for example, was effectively unplayable with the FAST command -- we hacked in a FOR I = 1 TO 5000: NEXT I delay loop in our version to slow it down.

I'm curious if any one knows how they implemented this pre-computing phase, and where they stored the derived offsets? I don't think they stored them inline with the code (though that would seem obvious) simply because they would have needed to invalidate them when a program line changed.

Did they cache these somewhere in RAM?

Any thoughts would be welcome.

Regards,

Will Hartung

I can vouch for this one (AtariSIO).

It comes int wo parts, a kernel driver that provides a reliable
SIO2PC device driver, and a server application (which is a text-based
user interface, much like the original SIO2PC and APE apps. for MSDOS.)

Since I don't have MSDOS or Windows in my house, this is what I use whenever
I need to boot my Atari up off of disk. (Well, except actual floppies
or MyIDE hard drive ;^))

Those were from the days of the XEGS (Atari XE Game System), which was
pretty much an Atari 65XE or 800XL, capabilities-wise.

I think some (maybe most or all?) Atari XEGS games will not run on the
400/800 (which, at the time, were from about a decade earlier!) They should
run fine on any XL or XE system. (Though the 1200XL can be iffy sometimes,
due to its OS ROM. Easily replaced, though! Gotta love socketed chips!)

I believe what you are looking for is explained briefly in the manual
on page 23 (both old and new manuals):

It basically says that under regular execution, BXL must search from
the beginning of the program for a given line number (just like A8
Basic). Under FAST, it does a precompile and *changes the line numbers
to the actual addresses of those lines*. Even under FAST, if the GOTO
or GOSUB is not a constant, then BXL must search for the line number.

That's all well and good, but the question I have is then how it switch back? I mean, after I ran FAST, and then, say, added a line, the offsets were then obsolete. Somehow the system had to "know" that so that it didn't reuse them.

I also don't recall how compatable BXL was with Atari BASIC. Could it read the actual tokenized BAS files directly or did it have to be reloaded using ENTER.

I can see how they could have pulled it off. Since a normal line number in AB was 6 bytes, they could have "cheated", used 2 bytes for the line number and the other 4 to store the address. But that still doesn't address updating the offsets.

As I recall, the FAST command took a noticable amount of time (particularly on large programs), so it probably wasn't reseting the offsets on the fly.

This is the mechanism that I'm curious about.

> See also: Atari BASIC The Good, The Bad, and The Ugly.
>
> http://www3.sympatico.ca/maury/other_stuff/atari_basic.html

It would be interesting to see some write ups on how these other BASICs were made to be faster.

> This sounds doable to me. ;-)

On long programs, it's a pretty notable delay. No doubt the space is there, and they used the BCD simply because the line number was actually an expression, so it would be easy to replace the 6 bytes with 4 byte address and a 2 byte line number for when you type LIST. But I don't think they repatched the lines when you hit break.

It is enough to do the patch when you save the program, the line numbers
can stay in binary as long as all other commands accessing this data are
aware of the alternative representation, i.e. "LIST".

So long,
Thomas

at least until you add a keyboard upgrade from Best Electronics. :)

I guess I'm like a lot of others who have posted to this thread though.
I've had both machines (800XL and 130xe) and while the 130xe is newer, and
technically superior, I do prefer the 800XL.

I'm going to give one reason that I've not seen anybody mention, so maybe
its just me (or cosmetic/aesthetic) - the 130xe looks too much like the ST
line! I love my STs, Mega, Mega STe, and my CT60'ed Falcon, but the 800XL
looks like an Atari 8Bit. :-)

Yea, but that's not the scenario I'm thinking about.

Consider you run a program, FAST executes and updates offsets, I hit BREAK,
change a line or two, and then type CONT or GOTO to restart the program, or
minimally restart the program in a way that FAST is not run again.

It's hard to say. I haven't touched BASIC-XL is *gulp* 20ish years, and
don't have access to it now.

I ended up getting a 130XE and overall I am happy with it. I don't
mind the keyboard that much.

However because I need a MyIDE ROM or Warp+ OS installed in my Atari,
I'm just gonna get an 800XL that has Warp+ OS pre-installed and sell my
130XE on eBay here soon.

Thanks,

Tom

->... I've had both machines (800XL and 130xe) and while the 130xe is
->newer, and technically superior, I do prefer the 800XL.

Let's see.... We were discussing this same point ten years ago on this NG, and five years before that on networked BBS bases, and five years before that on local BBSes, and five years before that on inter-linked dixie-cups-on-a-string ("DCOAS" technology), etc., etc., weren't we?! <grin!>

But seriously, I agree completely. I typed on those 130XE oatmeal keys for at least half a dozen years -- and those were prime Atari years, when I did all my word processing on the 8-bit. Then I "moved up" to an 800XL. Great keyboard; too bad I don't use it much anymore.

->I'm going to give one reason that I've not seen anybody mention, so
->maybe its just me (or cosmetic/aesthetic) - the 130xe looks too much
->like the ST line! I love my STs, Mega, Mega STe, and my CT60'ed
->Falcon, but the 800XL looks like an Atari 8Bit. :-)

In 1984 my computer (and Atari) mentor and I began a strategy of skipping every other generation of computer products: e.g., 300 baud to 2400 and then to 14.4, skipping 1200 and 9600. I went from 800 to 130XE and (as mentioned above) only later switched to the 800XL. I skipped the ST and went directly to "IBM" clone (386), then skipped several more generations to go directly to a Windoze laptop. This strategy has saved money and also avoided wasting time, effort, and resources on intermediate generations which would've become obsolete in an obscenely short period of time, anyway.

That's one reason I avoided the ST. My apologies for offending your predilection for the ST, but another big reason was that the ST seemed to me to be a dinosaur from day one. Too big & clunky; to me it LOOKED like a dinosaur. In contrast, the clones were leading the way to sleeker and faster machines, both stylistically and in performance. Today, almost 20 years later, I work at an office where there are a thousand computer terminals. In a general sense those terminals resemble the clone I'm typing this on, and a few people still have old models that look exactly like this clone. *Nobody* has a computer that looks like an ST!

P.S. Talk about "looking like an 8-bit"... The newest desktop shells and monitors where I work are either black or black-and-white, just like my black Induses and black-and-white 800XL! (How about this suggestion for the next fashion fad in computer hardware colors:

checkerboard red-and-black, just like our 8-bit Wico joysticks and
trackballs! Yeah!! <grin!>)

Maybe I am ignoring some fact that has already been presented
somewhere in the thread, but don't you think that break and edit
simply invalidates the state, so the program is no longer
considered precompiled and "fast" by the run-time environment?

Also, wouldn't it be cool if idle CPU time, which there is a lot of while
you are editing a program on a single-task computer of the 80s, was
used in the background to do precompilation activities and
continuously catch up with the recent changes made?

Well, would definitely be cool, but I don't think so. Multitasking on a
6502 is not all too easy because it has a fixed stack at page 1 you
would have to swap, and the point where the CPU idles is within the
Os keyboard handler waiting for a keypress, so you'd need something
beyond "cooperative multitasking" (aka the cheap brother of real
multitasking).

So long,
Thomas

In this case it would not be a multi-tasking operating system, just
the same piece of software sharing CPU time between its own
tasks. It is a software issue and the presumably simple
precompilation task must be possible to run in the
background, although some hacking is required.

I have to say that the best keyboard for the 8bit series happens to be the one on the 1200XL (which is also found on the 1400 & 1450XL's). That keyboard has the smoothest touch and best tactical feel. When you press down on the keys its soft. There's no hard push back when the key is pressed all the way down. Like a hot knife thru soft butter!

I did the TT touch upgrade on my 130XE. It was a kit that you bought that contained replacement springs for the keyboard. Didn't seem to make much of a difference to me.

Mitsumi made those keyboards. I can never understand why no one makes them like that anymore. I've seen a keyboard made by Keytronic for the PC one time that came close.

No. The 5200 had one LSI device, the PIA chip, removed and its functions like J/S handling taken over by the POKEY chip since there was no keyboard. Of the LSI chips, one was moved to $D300.

Other then that, they are mostly the same.

That's all well and good, but the question is basically where did they store that information. It's easy to reset the "run FAST" bit in the interpreter after every code change. Then you would mark the FAST buffer as "dirty" so it could be overwritten.

The problem is that this information cost (minimally) 2 bytes for the actual pre-computed address.

If you store the information in a seperate area of RAM, then you need at least 4 bytes (2 bytes for the line number, 2 bytes for the address).

So, if I have a 500 line BASIC program, that information is 2K of data. We may laugh at 2K of data today, but that's over 4% of the RAM available on a 48K machine.

It doesn't seem space efficient for the speedup. However, by leveraging the 6 bytes that normally consume a line number, that's the perfect place to put the precomputed information.

Actually, now that I think about it, I think this would be the way to do it.

You store a "FAST" bit someplace in RAM. After the FAST command is done pre-compiling, you set this bit to 1. Whenever a change is made to the program, that bit is reset to 0.

In the GOTO statement, for example, you look at the 6 bytes that contain the line number ala classis Atari Basic. When FAST is run, it converts those 6 byte into a flag byte (telling us that it's in the new FAST format), 2 bytes for the original destination line number, and 2 bytes for the calculated address.

When the GOTO statement executes, it checks the line number. If the flag byte is there, that means that it was pre-compiled (at some point) by FAST. It then checks the FAST bit. If that bit is 1, is assumes that the address there is valid, and then jumps to the address. If the bit is 0, that means that FAST was run at some time here, but the address is no longer accurate, so it just grabs the line number from the 2 bytes, and runs the old behavior.

When a new line is entered, it uses the original Atari format. When a program is saved, it converts back any FAST compiled lines to the original format.

That seems like a clever way to handle this. It even handles programs that run FAST, but then create new code on the fly, since the code change will reset the FAST bit.

Now, I don't know if this is how it works, but it sounds pretty good.

Regards,

Will Hartung

Just speculation but wouldn't you only need a table entry for each
occurence of GOTO, GOSUB or THEN (line number), and not for all BASIC
lines?

During execution when a GOTO (etc.) token is reached you do a table
lookup instead of searching the entire program for the target line
number.

This has the advantage not modifying the tokenized program on the fly
and not having to deal with forward or backward references.

(my 2 cents)

I have this setup in two of my machines, and a 256MB card works great. It really depends on how many partitions you want set up. For example, say you want to set up 8 hard drive partitions. You can make partitions up to 16 MB in size, so that means you need 128MB total for all 8. However, because you're talking about 8-bit addressing with the Atari, you actually need a 256MB flash card in order to allocate 128MB of usable hard drive space.

Hopefully that made sense. :)

The 5200 has a minimal BIOS that is not the same as the 400/800 BIOS,
it uses analog only controllers and the VLSI chips are mapped to different
memory locations.

Software written to run an a 400 can be converted to run on the 5200
with some effort, adding your own BIOS and routines to read the analog
controllers, etc.

Also keep in mind if he has MyIDE 4.1 or higher he can only access 3
partitions at a time.

One other thing to keep in mind, if you want to use image slots and maybe
copy Mr. Atari's movies.

I agree, I use a 256mb card primarily also.

Thomas

Is this you, miss spineless? What is your problem? Don't you have anything useful to do besides suck lemons and eat prunes?

How does trying to sell sinclair computers on a sinclair newsgroup equate to , "Does spamming and screwing people out of their money make you feel good?" ???

I haven't sold a thing from this lot, so who's money am I taking, genius? Dude...seriously what is your problem?!? If you are not interested in buying anything from me - how about keeping to your own business?

And then e-mailing me with no return address?

LOL!!! HOLY COW!!! LAXATIVE ANY BODY?!?!

Unbelievable - what is wrong with you people? I am trying to sell some classic computers to users subscribing to classic computer NEWSGROUPS! What 'CRIME' does that fall under? Perhaps I should submit it under "pets.forsale"?!!!

AND I'm one who is sick of IDIOTS trying to buy it with "poster money orders" from Nigeria - hence my clarification for these idiots before they even ATTEMPT to e-mail me. And THIS makes 'ME' a scammer and untrustworthy??!?

Seriously - I don't know what your problems are but if you do not have an interest in buying anything - please don't waste your time with your moronic theory's and rhetoric/sarcasm.

I am not scamming/spamming anyone, I am a legitimate seller in Denver [Aurora], Colorado,and I am simply posting a lot of computers I loved, for sale, hoping someone else who ALSO loves this stuff and who would put it to GOOD use - i think your hot air could be best used barking at someone actually doing something wrong, unless you have NOTHING better to do then prove your self this way - then bark on- it *IS* a free country.

Rich

That's an option. My technique doesn't take any more memory, though, which is a bonus, and it's pretty much transparent to anything save something intimate with the internals of Atari Basic.

> This has the advantage not modifying the tokenized program on the fly
> and not having to deal with forward or backward references.

Well, recall that FAST does make a run through the system when it's executed. Otherwise it could have achieved a similar benefit lazily, simply running the program and caching lines as it encountered them.

However neither technique has an obvious implementation for NEXT statements, which were also FASTed. I don't know how they're represented, but I assume that it's just 2 bytes in the token stream. 1 for NEXT and 1 for the variable reference. It's also not clear how the system scanned for the appropriate FOR statement.

My understand was that in MS-BASIC, the runtime pushes some statement reference on a stack. Maybe in FAST mode B-XL pushes an actual address, while Atari Basic pushes a line number (even though a line number isn't enough information).

Regards,

Will Hartung

Well, I suppose that you could say that some of the Amiga computers look vaguely like an ST. The Amiga 500, etc., have the same form factor, albeit with a somewhat more pleasing style. There were some Macintosh computers that sort of resembled the Mega ST line. The Quadra 605, for example, was very similar to the Mega 2 and 4 ST computers.

I owned a 520ST for a brief time before rediscovering my 800XL and finally moving on to a Macintosh Classic II. I don't quite know what is was about the ST that irked me so, but I was definitely turned off by that architecture. To me the ST computers felt really cheap. I mean I could grab my 520ST at each end and literally twist the case in my hands. And I'm definitely no he-man superhero type: I have the muscles of the stereotypical computer geek and the eyesight to match (minus taped spectacles).

You sound like a Kiss fan! "...when I go through her, it's just like a, a
hot knife, through butter..."

But then the same old disclaimer applies, "I can't believe it's not butter."

Which leads to the whole concept of "Guns & Butter". Which would you rather
have? The guns or the butter?

Anyway, getting too far off topic...

That's the way that I does it. Clip the pins, remove the chip, and heat
and remove each pin individually. Personally, I hate removing components
that are soldered to the board. So I typically shy away from such things.

{begin rant}
On a completely unrelated note, I never shy away from corruption or a battle
with corrupt folks that think themselves smarter than moi. Cuz they're
usually not smarter, and their necessity for corruption is really a
testament to their stupidity.
{end rant}

I'M the drama queen?! I am simply trying to sell honestly and the "drama queens" such as yourself, OBVIOUSLY with NOTHING else better to do, create such a mirage and soap opera of DRAMA, it is sickening.

Again, if I am doing something wrong - AND you can prove it without drama, PLEASE do. The last time I checked, it was not illegal in ANY country to try and sell computers to possible computer buyers and protect one's self in doing so. As for cross posting - it would be one thing If I posted to a microsoft group, or a horses group by the dozens - but it was a post to 8-bit computers groups - CLASSICS! This is off topic there?! Check your logic chips chuck.

You know what...whatever you need to do for your entertainment, fine. I don't have time to justify your evident boredom - typical behaviour of your scam/spammers or not. If I thought about it long enough, I'd think some of ya's are insulted by my hatred for scammers and are simply retaliating accordingly- THAT is typical behaviour

Yes you can buy the MyIDE flash cart from Steve Tucker, or the XE/XL MyIDE
from Ken. If you use the MyIDE device, it disables the PBI routines and you
cannot use the MIO.

Thanks, I just sent a e-mail regarding it.

I wonder if it is a must for the PBI routines to be disabled?

I would sure like to use my MIO with this device, so that I would have
Modem support. Has anyone looked into a possible work around?

I may send Steve an E-mail about it, if he isn't reading this already.

I'm abit confused, are there 2 different products with the MYIDE name?

If so, maybe you can give me a brief description of both.

Thanks,
phantomm@bellsouth.net

I have a free chat system set up if anyone is interested in chatting about your favorite computer. I only have a windows client available, but will be working on a linux client in the near future.

To sign up, visit http://boycot.no-ip.com/boycotchat If you don't get the confirmation email after you sign up, email me and i'll activate your account.

To get the client software, visit http://boycot.no-ip.com/software/ and click the "BoycoT Chat Client" link.

Hi,
There is a cartridge and a built in..either one comes on a board with a 40
pin connection to IDE drive. The internal requires several solder point to
be connected to MyIDE and a change of ROM for EPROM's
xxe.rom is for the external via cart.
xxi.rom is for the internal via --open it up and scatter parts around and do
a lot of soldering.. LOL
Nice thing is that every xl/xe con be modded easily.

RoyE

>
> If so, maybe you can give me a brief description of both.

The 'internal MyIDE' board is a cpu-socket module that contains
a buffer chip and the IDE connector. To use it you need to replace the
standard OS with the MyIDE OS rom module or Warp+ OS upgrade
containing the MyIDE OS rom.

The 'external MyIDE+Flash' cartridge is a MyIDE interface on a
cartridge with a built in 1mbit flash cartridge which is loaded with
a boot rom.

When you insert the MyIDE+Flash cartridge you get a on screen
boot menu that lets you choose cartridge/basic options, or bypass
the interface completely. It also contains a software MyIDE OS that
is loaded over the regular OS when MyIDE boot is needed.

These boot utilities do not use up the entire 1mbit flash rom so
there is also room for other utilities like Hiassoft's MyPicoDOS which
lets you load EXE files off your IDE partitions.

Because the boot rom is actually a 1mbit flash cartridge you can
update to the newest boot rom released by Mr. Atari just by flashing
your cartridge.

There is an 'external' version of the MyIDE ROM OS which you can install
in ROM to improve compatibility with software that requires ram under
the OS, but it is not required to use the cartridge. If the MyIDE OS is present
in ROM the cartridge will use it instead of installing the software boot rom.

The internal MyIDE can be obtained through Mr. Atari's web site at:

http://www.mr-atari.com/

The MyIDE+Flash cartridge is sold be me at:

http://www.atarimax.com/myide/

The Warp+ OS module information is at:

http://www.atarimax.com/warpos/

Finally there is a support forum for MyIDE which Sijmen participates in and
can be reached through at:

http://www.atarimax.com/flashcart/forum/

Thanks

Steve

Hi-

If you GOTO www.atariarchives.org, you will find a wealth of programs to type in from the books that have been scanned/OCR'd. In some cases, the software is already available, but in most, they are not. For instance, the First Book of Atari has the software available for it. The Second Book of Atari doesn't. If software is already available, it will normally say "Software Archive" at the bottom of the book's index. Some books are "all-purpose" and programs must be translated a little to work on the Atari. I suspect there is enough there to keep you occupied!

-Larry

I can't understand why you'd want to involve yourself with such tedious
chores, unless you're looking to learn by example. However, I'd have
guessed from the fact that you've been contributing to this group for a
long time, that you already have a fairly solid grasp of Atari Basic.

Personally, I only typed in listed Basic code as a means of learning by
example. Once I achieved a fairly decent understanding of the Basic
language, I began writing my own code, and using software that other people
had already made machine readable. But to each their own.

http://www.atarimagazines.com

Kevin Savetz's site. Has all Antics.
The programs are there as SAVEd listings, so you'll have to
LOAD, LIST them. You can use emulator and imageman.exe
to get the ATASCII listing, except the problem of ATASCII
control characters. Hmmm... Actually, if you use a real
Atari computer, AND have a STAR printer (very unlikely),
you can list the ATASCII with the "G:" device. Well, if you
have a real Atari setup, you can just list it to screen and type
from there.

True, but I was considering what happens during editing.

Would there be enough time, between edits, to update the entire
sequence of addresses within the body of the program and not feel
"laggy" to the user.

> > This has the advantage not modifying the tokenized program on the fly

> enough information).
>
First for convenience I'll use the term "line" and "line number" not
"statement" and "statement number".

Lines can have multiple BASIC statements but not the reverse.

Sometimes I get careless and use "statement" and "line"
interchangeably, forgive me if I slip or have slipped.

Well, I guess FORs are a special case.

A FOR statement can occur in the middle of a line. When the NEXT is
encountered execution returns to the beginning of the FOR statement and
not to the beginning of the line.

Hmm, I don't know quite know how to implement that in a simple table.

OK, that's another thing to think about. LOL!

I mentioned in my first reply that with a table one didn't have to
worry about forward/backward references. Obviously that is wrong. The
table must be updated when editing is done.

I'm thinking the table would need to consist entirely of the line
number (for the GOTO, etc) in binary form, the binary address of that
statement but as an offset (from the beginning of the program), and a
binary offset for the target as well.

During editing the location of a new or edited line would be determined
and the table of offsets would be adjusted based on the new line size
and location.

Entries lowered numbered than both the GOTO (using just GOTO for
convenience) and the target would be unchanged.

If the new line is between the GOTO and the target then only entries
with line numbers higher than the new line but lower than the higher
numbered statement of the two, need have only one offset updated.

All entries with a line number higher than both the GOTO and the target
would have both offsets updated.

Does this make any sense to anyone but me? LOL!!!

It will be fun to learn how FAST really works!

- Steve Sheppard

Some people are like that; As has been pointed out, there are still a few
listings on web sites that don't have the relevant software download.
Somebody may want to enter them, debug, and upload them so others can
enjoy.

Some people are givers. Others are takers.

Touche! I never considered that aspect. I just naturally assumed that
all of the magazine listings were already in machine readable format, and
ready for download. I guess I based this assumption on the fact that most
of the magazines also offered disks with their mags.

Upon re-reading, I think 'printable' is the key word. You're thinking
of printing out a listing and typing from that.
The problem is ATASCII control characters, which about all
BASIC listings will have. I'm not aware of a PC program that
can print control characters.
So, the only way I see doing it is have two systems, emulator
or real, and listing to screen, and typing from screen. Another way
would be to buy some Antics or ANALOGs. Or, you could
look at www.atarimagazines.com and pick out a program you
want, then ask here to see if someone will copy it for you and
mail or e-mail a scan to you of the listing.
But I ramble.

I recall doing it years ago. Until the machine specific mags started
using error checking routines to check programs either after or during
entry, typing in the code was, to say the least painful.

Anyone that typed in the ANALOG mag MC games that were primarily DATA
statements can put their hand up now......

Even when they used a checking program for that, it was painful.

It wasn't meant as a dig at anybody in particular. Just a general
observation.

> all of the magazine listings were already in machine readable format,

Not always. Over here, even some of the machine specific mags didn;t
offer disks for quite some time. Then there's the generic mags; With
listings for four or more machines, what format the disk?

One additional point specifically about magazine type-ins. At
http://www.atarimagazines.com/
(the sister site of atariarchives.org) there are a significant number
of COMPUTE!s scanned/OCR'd. There are very few of these that have a
software archive. Yet, COMPUTE! had some very excellent programs.
(OK, their BASIC games generally were like most BASIC games...) You
can also search by Author, so it is easy to find (for instance) Bill
Wilkinson's "Insight Atari" columns. -Larry

Well, I got everthing working again. How? I wish that I knew. I never seemed to get the same results twice until I did several things. I'm reasonably sure that the POKEY was not bad. C304 was already clipped on this computer, but I went ahead and clipped the whole remaining bundle of 301-303. But after that, still had the I/O problems with the real drives (an XF551 and a 1050). APE drives still worked.

But there is one wrinkle that I didn't mention before -- I use a Quintopus, so naturally, the APE interface is not daisy-chained from the real drives. While switching connections around, I found that if I hooked my SIO cable to one port on the XF551, everything worked. Ah-ha! Opened up the XF and checked the traces with a meter. Every pin had continuity from one port to the other. Looked things over with a good magnifying glass and found several suspect solder joints that *might* have cracks. Re-soldered every SIO pin on both XF jacks. Hooked everything back up, and no I/O at the "good" port. Swapped Quintopus ports. Same story. Looked the Q. over with the magnifying glass -- nothing suspicious. Swapped out both drive SIO cables. Hey, now everything works 100%. Can't make it fail. Copied hundreds of files from both real drives to an APE drive. Intermittent bad cable? Could be. I had swapped cables before, but not *both* cables. So all is well ...for now.

Tom Watt <tom@wattservices.com> wrote:
> So each scan line can be 4 colors of a pallete? I assume that pallete
> is 16?

It's a bit more complicated than that. :^)

With player/missile graphics, each scanline can have 9 colors.
It's out of a palette of 128 colors. (16 hues, 8 shades of each.)

Forgetting about player/missile graphics, a typical bitmapped graphic
mode (e.g., 160x192 bitmap) allows 4 colors, and hence 4 colors per scanline
if you use Display List Interrupt (DLI) tricks.

However, there are a few multicolor text modes, where each cell is
a character that's 4 pixels by 8 pixels in size. (It's still 8x8 binary
dots, but every pair of bits are used to decide the color. In other words,
rather than 8 on-off pixels per row, you get 4 4-color pixels.)

In normal text modes, the high-bit of the character controls reverse video
(kinda like highlighting). Character "65" is "A". Character "65 + 128" is
an inverse "A".

However, in these multi-color modes, the high-bit is used to alter which
color palette entry is used for one of the pixel colors. Confused yet?

In other words, in a resolution of 40x24 or 40x12 cells, you can get
160x192 or 160x96 pixels on screen with 5 colors per scanline.
Really, this is best for tile graphics (like you'd do on a Nintendo NES),
rather than a fullscreen bitmapped image.

But THEN you've got the special GTIA graphics modes. These are those
insanely-shaped 80x192 screens. Each byte represents 2 pixels, allowing
16 colors per pixel, in a sense. (And therefore 16 colors per scanline.)

However, because the Atari initially only used 9 palette locations
(4 for playfield, 4 for players, and then the '5th player' color, which
could be used for turning all 4 missiles into the same color... it's also
that "5th color" I discussed in the multi-color text modes, above),
one of the three modes is only 9 colors.

So, you've got:

GRAPHICS 9 - 16 shades of some hue
GRAPHICS 10 - 9 paletted colors (out of 128)
GRAPHICS 11 - 15 hues of some shade, plus black

GRAPHICS 9 is great for showing low-resolution photographic imagery.

GRAPHICS 10 has been used heavily, I think, for special effects in demos.
(A screen that looks a lot like GRAPHICS 9, but with color palette effects
for animation.)

GRAPHICS 9 can also be used, together with GRAPHICS 11, to display
a perceived 256 colors (16 hue * 16 shade) at a time. APAC mode, for example.

(You can either interleave to get a perceived 80 x 96 x 256-colors,
or actually interlace and flicker to get 80 x 192 x 256-colors.)

GRAPHICS 9 can also be used with three hues (red, green and blue) to get
a 'truecolor' mode, utilizing interlacing and interleaving, to get a
perceived 80 x 192 x 4096-colors. (Yes, 12bpp!)

Similarly, the 160x192x4-palette mode can be flickered in RGB colors to
give 160 x 192 x 64-colors. (6bpp)

And 320x192x2-shade mode can be flickered for a perceived 320x192x8-colors.
(3bpp)

But now I'm digresssing into the persistence-of-vision, flickery
software-driven modes. Sorry :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Lee! You've quietly added support for Mr. Simonson's Mac/Atari Fusion
TrueType Fonts!

You are awesome!

Great, great, great utility!!!

6684. ICD MIO Memory

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-17 19:09:19 UTC
From: phantomm <phantomm@bellsouth.net>
Message-ID: <mxKag.51969$MM6.35178@bignews3.bellsouth.net>
Source record: 6841

Back when ICD came out with the ICD Multi I/O (MIO),
memory chips were fairly expensive.

The MIO was offered in 256K and 1 Meg versions.

I wonder what the limit of Memory is for the MIO?

Could a 2meg, 4meg, or larger version have been made or is
1meg the limit?

phantomm@bellsouth.net

> phantomm@bellsouth.net

I would imagine that upgrading the memory in an MIO would be just as simple or as complex as upgrading the memory in any computing device. Although, there remains the question as to why you would want to.

The memory in an MIO served as either a print buffer or a RAM disk. One would suppose that both the 256K and 1024K configurations would have been more than sufficient for these purposes. After all, there is only so much material that an 8-bit Atari can output to a print device, and only so much data that an 8-bit Atari can have in a RAM disk before losing the practicality aspect. One could probably reasonably suppose that the 1024K configuration was overkill at the time of the MIO's release.

Today, with SCSI hard drives being so abundant and cheap, and with the recognition that many current Atari 8-bit users have upgraded the memory in their machines, there remains little reason or need to upgrade the memory in a device like the MIO. Indeed, it is quite probable that the folks at Computer Software Services accepted this reality while designing the Blackbox. The Blackbox, as you may know, has very little onboard memory and many Atari 8-bit users believe the Blackbox to be the better alternative to ICD's MIO.

Source record: 6846

And when MIO's break, they break hard. The memory circuits in the MIO is quite complex and difficult, to say the least, to troubleshoot. There's diagnostic software for the MIO that runs on a Spartados X style cartridge but has no documentation on how to use it.

If you still operate a MIO, make sure that thing get's plenty of cooling. The heat damage alone from the MIO's own power supply is enough to create plenty of heat stress on the circuit board to eventually cause minor fractures in circuit traces and take out something like the SCSI interface or memory circuits.

At least the Blackbox is easier to repair when it goes bad and has support for MIO formatted hard drives.

Too bad fTE didn't see thru on the project of a MIO2. A redesign of the MIO using FPGA technology would have been a significant improvement (use SIMM's instead, 80 column video, IDE support). And I know, too bad fTE didn't see thru on a lot of other things. But that's already been discussed many times before.

As these drives are getting old now, is it worth arranging extra cooling,
would it be possible to run a small 40mm fan from the intrenal power without
causing problems ? Where would you take the power from ? Any thoughts?
ideas? not worth the bother?

thanks

years? LOL!!!!

Found this at hit #4 of a Google search.

www.acidfonts.com

Direct link to matrix fonts

http://www.acidfonts.com/dfonts10.htm

The one labeled "Dotimatrix" looks like my old Epson MX-80, at least in
print it does. On the screen it looks a little funky.

"Dotmatrx" is oversized and kind of reminds me of electrostatic
printers, without the silver paper of course.

Don't know why you would want these but please do enjoy them.

CORRRECTION:

This was the #4 hit. The above links and comments are valid.

http://www.free-fonts.com/matrix_fonts.html

In my opinion, they did not have fans to begin with. That leads me to believe they were designed to not need the. So I would imagine they should be fine without any extra cooling. Now, if you were going to run the floppy drive constantly maybe a fan would be in order. However, it does have a very large heat sink, and the transformer is in the power pack, not the drive itsself. I would say you would be ok.

I'm not sure that the age of the 1050 would require more
cooling considerations.
I would recommend a fan, a table fan, a 5" 120Volt fan,
in the vacinity of any hard or floppy drive that is left on
continually.
My Rana drives would quit functioning unless I had a fan
blowing at them, they were on 24/7 on a 300 baud BBS.
A simple table fan would do.
I used to stack floppy drives, 4 if I recall. The Indus seemed
to not overheat.

I would have to agree with Docrotcod. The 1050 drives really don't get
that warm, and typical 1050 failures are not heat related. In all
likelihood, if your 1050 drive is going to fail, all the cooling in the
world would not prevent the failure from occurring.

The Rana drives on the other hand, get quite warm. I had a Rana 1000 for a
spell, and parts of it would get too hot to even touch. If you're leaving
a Rana drive powered on for extended periods of time, cooling might be a
good idea. But like somebody already mentioned, a simple table fan would
be more than sufficient to provide adequate air circulation and cooling.

Now, to go off-topic, I just noticed that Docrotcod is Doctor COD in
reverse. Like a doctor that demands cash on delivery. ;)

I've seen 1050s that had a PC fan installed in the top of the case for
cooling. As far as I could tell all the fan accomplished was to draw in large
amounts of dirt, since the PCBs and mechanisms under the fan were covered
in a thick layer of black sticky grunge.

Most 1050 failures are not from excessive heat, so I would say its in the
'not worth the bother' category.

ACK. But then, the large electrolytic capacitors also don't like heat
too much. In one case, parts of the power supply circuit inside the
1050 had died because one of the caps died.

BTW: It's quite easy to cool down a 1050. Most of the heat comes from
this silly design of the power supply (9V AC input doubled to 18V, then
a 7812 to generate +12V and a 7805 to get +5V). Most of the power is
immediatley transformed into heat.

So: desolder out both voltage regulators and directly connect +12 and
+5 to the 1050 (you an use a PC power supply, for example). The power
switch at the front of the 1050 won't work anymore (you have to use the
power switch of the external power supply), but the 1050 will be a
lot cooler.

so long,

Hias

In short, I can see quite a few reasons for increasing the memory in the MIO.
One is for storage of large files that are not Atari 8-bit. One could move files
from a different platform into the MIOs memory using a null modem cable or etc.

Also, One can run a entire BBS such as Express in Memory while only using the
hard drive for file storage. With enough memory, some files could be stored in
memory.

There are other uses as well.

The BlackBox is good, it does have better hard drive support.

I've not seen any MIO's break, other than for minor problems with Cables.
As these things age, Componet failure will be more common.

Overheating can be a problem, but a simple Fan upgrade fixes that.

I've never owned a BlackBox before, I started to buy one once, the main
reason I didn't was that it didn't come in a case. I think you had to pay
quite
abit extra just for the case when they first came out. I had the MIO, with
hard
drives and it worked well for me. Even had Diamond GOS running on the Hard
drive with a mouse, similar to a ST, but too slow to really use.

Both have there good and bad points.

I'd say no and any manipulating you do using those fonts won't get that effect either.

I remember that printing mode on dot-matrix printers. Basically each vertical column of the matrix was printed twice giving the double wide, bold, look.

Check that revised link and follow where it leads. Perhaps someone produced the double wide font, somewhere.

You might also try a search for emulated printers vs just reproduced fonts. Perhaps a virtual printer program exists that simulates the actual print modes.

Regards,

Steve Sheppard

I really don't want to poo poo your idea, but why would you want to move large files from another platform on to your MIO? Unless I'm totally missing the boat here, I can't see any practical reason for doing so.

The BBS idea, I will admit, is practical, but what kind of a BBS would you be running on an Atari 8-bit where the support files would exceed one megabyte? And with hard drives being so cheap and plentiful, the speed difference between a hard drive and a RAM disk, at least on an 8-bit Atari computer, would be negligible.

I'm not saying that it can't be done, I'm just saying that, in my opinion, the benefit to doing so would be marginal.

By the way, a null modem cable wouldn't give you much throughput, at least not enough that you'd notice a difference in speed between a hard drive and RAM.

I seem to recall the ICD MIO's being ripe with problems when they were released. I had considered purchasing one, but the owner of the closest Atari retailer talked me out of it. It seems that the bulk of the MIO's that he had received from ICD were problematic and prone to failure.

I can see that you have had no problems with your MIO, so that's a good thing I suppose. I would really suggest that you upgrade the memory in Atari computer as opposed to the memory in your MIO. Either that, or get a bigger and/or faster hard drive.

For my BBS, the reason for putting the support files in the ramdisk was seek time. You start loading a lot of small text files and command files on a scsi 20mb hard drive and you'll see why accessing from RAM is the way to go. Plus back in the day if your computer died, reboot and you still have everything in resident memory.

This is true, but do you have 1MB of BBS files on your MIO? I mean, Atari
8-bit files are tiny and you can fit an awful lot in a 1MB RAM disk.

Been a long time since I actually <cough> read the BBS Express manual, but
I believe it even recommends using a RAM disk for this...not sure about
other BBS software, although I'd imagine it would be similiar.

Folks, we've got 13 player slots left in Final Frontier 2. The game is progressing slowly, so it will probably extend into next month. So I'll add another $25 for a total of $50 then, as the cash prize for the winner.

Watch out for the Satharians! (computer AI). They've already found me twice in the deep recessess of space and slagged me. (curse them and consign them to the netherworlds!). :)

I don't think a 1050 needs a fan at all.

Electrolytics dry out over time, they're just a known problem that you will have to replace them every so often as part of servicing.

Fans will wear out, be noisy, and force dusty air into your drive. So they might be counter-productive.

As was mentioned, the PSU generates most of the heat so you could use an external PC PSU.

Personally I would replace the linear regulators (7812,7805) with small switch mode PSU chips. These would be small, cool, reliable and silent.

Or fit a 1Gbyte SD card interface. ;->

6715. Hyper+XF English Docs?

The only English docs that I can find for the Hyper+XF mod are a
BabelFish translation. Certainly a lot better than no translation, but
is anyone aware of a "tweaked" English version?
Also, something that I can't find in the docs is the optimum sector
interleve. Same as a Doubler -- interleve of 9 in double density
(IIRC)? The Black Box handles many of the details automatically, but
using this with the MyIDE O/S, some of these details must be handled
manually, such as formatting with high speed skew. Thanks, Larry

Yes, but high temperature will drastically reduce the lifetime. Just
have a look at the datasheet of a standard 85ï¿œC cap. At 40ï¿œC the
lifetime is usually specified at some 50000-70000 hours. At 85ï¿œC
it's only 2000-5000 hours.

> Personally I would replace the linear regulators (7812,7805) with small
> switch mode PSU chips. These would be small, cool, reliable and silent.

Drop-in replacements for 78xx aren't too easy to get and usually also
quite expensive (although, if you manage to get them, this is a very
simple solution).

Building a step-down voltage regulator by yourself (i.e. use one of
the standard switcher ICs plus external coil & cap) is too complicated
if you don't have the experience and the right equipment. You'll need
at least a scope (to check if there's no ripple coming out of the
circuit that might interfere eg. with the read/write head amplifier)
and also the experience to buy the right parts (you need a cap that's
suitable for use in switch-mode power supplies and can stand the high
ripple current, otherwise it might just blow up).

OTOH: desoldering the 78xxs and running three wires (+12V, +5V, GND)
from an external (PC) power supply into the 1050 is a very simple
thing and you don't need special equipment, except a soldering
iron :-)

so long,

Hias

Probably 90% of the problems with 1050s are the voltage doubler<as I
think you mentioned>

Atari was apparently aware of it. On latter models of 1050 they mounted
the diodes ~1/2" above the board with extra lead bent out to isolate the
heat a little better. I seem to recall replacing the diodes with bigger
~3 amp ones which created some problems of its own: The leads were so
big they wouldn't fit through the PC board w/o trimming.

I think if I were to repair one now I would just use ~ 1/4" wide copper
strips with the end cut down to fit through the PC board, then mount the
diodes on those off the board.

BTW: You probably don't need to circulate fresh air into the enclosure
to get cooling. Since the heat mostly comes from the voltage doubler
circuit, just circulating the air inside the case is probably enough.

Funny thing is even the regulator Atari liked to use, 7812T 1.5 amp, is
not a real standard part you find at Radio Shack either.

The 12VDC is just for the motor. I've seen older designs that don't even
have a regulator on the motor power supply. Sometimes I really wonder if
Atari really needed the whole voltage doubler circuit or if they
should have just used a simple circuit with just a full wave bridge and cap.

6718. DD Interleave of 6

I'm trying to experimentally detrmine the fastest double density interleave that the Hyper+XF 3.5" will accept without "missing" sectors. So far, I've used 8 and 7. I found that 7 is actually the UltraSkew interleave listed in the US Doubler docs. 7 is faster than 8, so I'd like to try 6. Does anyone know how an interleave of 6 is ordered? Or better yet, an algorithm to generate a given interleave? Thanks, Larry

Hi Mathy-
Interleve/Interleave. Still looking for the docs, but I found the
Doubler sector layout with seven. Then came up with my own six-sector
interleave, and it is too little. At six, the drive's response is not
smooth. Seven is as good as it gets, I think. -Larry

yeah, I turned on my Atari 800xl and played a game of MULE against the computer.
I use an SIO2PC cable which is nice plus I have a video converter so I can use my PC monitor on the 800xl.

Anyway, this was one of the 1% of the time when I don't WIN. I was so annoyed that the computer mechtron beat me.
But weird events transpired during the game......unseen forces worked against me.
I usually know I'm gonna win so I play with a goal to reach 100,000 for the colony and 30,000 for me.
Stupid pirate ship, store burning down at bad times, etc.....thwarted me.
I came in 2nd by only $300 and about 28,000 total. Colony was just over 97,000.

It's one of the fun things about the game - you just don't know whats going to happen. MULE is a classic!

OK - I gotta go turn on "alternate reality" and pretend it's 1986....that'll be my personal alternate reality for the evening.

M.U.L.E.?

That game is unbelievable! (Pure Assembler.. great gameflow)

103.000 today. Got 3 Nechtrons with me... 3 to 4. I've made the 2nd
Place with 5 plots at the end. ;-) 17.000 credits - just being the food
and energy giver. Cheap prices, of course.

Best Regards,

I also don't think they are black art and I guess you do know what
you are doing.

But the average hobbyist doesn't have the knowledge and the
equipment (at least, that's my experience). It starts where people
are unable to fully understand the data sheet (eg to choose a
replacement part if the mentioned type is unavailable) and ends
where they try to debug a non-working circuit.

With a 78xx you can't do too much wrong, it may start oscillating
if you forget the 100nF caps and get hot, but that's about it.

For the average user without a scope switch mode PSUs will
(at least to a certain degree) always be black magic. It's next
to impossible to tell what's going wrong if he's only got a
simple voltmeter (that usually will just show garbage it you
try to measure AC at several kHz).

I really like switch mode PSUs, but I see too many problems
for the average user to successfully build them on their own.

so long,

Hias

I started playing with SpartaDOS last night with MyIDE. Finding the files and crap I needed to set it up was daunting, to say the least since Mr. A took all his files down.

Anyways, I require a little help here. How the Hell do I parse the SD command line? I have scoured every place I can think of to find info on it, and I can't find any kind anything other than scarce mentions of the command processor itself, but not how to read the command line input from whatever program I write.

Anyone have a manual or something that says where in memory the input string is stored?

Thanks,

Hello,

I had started an ATASCII editor for Windows a few years ago and then
got occupied with other things. After seeing Lee's ATASCII viewer I
was inspired to go back to mine. Mine still does not have editing
ability but it is able to view and convert end-of-line characters.

I call it Memo Pad and you can download the first release here:
http://joyfulcoder.com/software/memopad/

Thanks,
Eric

Hi the Manual:

SpartaDOS User Accessible Data Table
comtab is pointed at by DOSVEC which is at peek(10).....etc..
comtab-10 through comtab+63

I think the one you are looking for is comtab+33.

There are several places www sites that has the manual in html.
http://ftp.pigwa.net/stuff/collections/atari_forever/Ksiazki/SpartaDOS%20X%20-%20manual.pd
f
PDF format and you may have to copy paste this addy..
http://www.celebritybase.net/atari8/SpartaDOSXManual/

and page #
http://www.celebritybase.net/atari8/SpartaDOSXManual/User_Data_Table_Programming_pp_06-16.

What is it that you want to do?

You want to retrieve the string you entered at the SpartaDOS prompt from
another app? Why?

Hi again:

Also if you can't get to the www sites this might help:
From a web site:

The following assembly language program demonstrates one way to read
the SpartaDOS command line. It simply echoes the command line with the drive
specifications added or translated as necessary. It resets BUFOFF to 0 so
that the name of the command is printed, too.

```
; CIO and IOCB equates
ciov .equ $E456
iccom .equ $0342
icbal .equ $0344
icbah .equ $0345
icbll .equ $0348
icblh .equ $0349
write .equ $09
; SpartaDOS equates
comtab .equ 10
```

```
zcrname .equ 3
bufoff .equ 10
comfnam .equ 33
; The program.
*=$4000 ; or wherever.
init ; patches our crunch routine to
ldy #zcrname+2 ; be the same as the COMTAB one.
ldx #2
loop1
lda (comtab),y
sta crunch,x
dey
dex
bpl loop1
; zero BUFOFF
lda #0
ldy #bufoff
sta (comtab),y
mainloop
jsr crunch ; get next command line entry.
beq exit ; quit if there are no more.
; Set up for CIO print of data at COMFNAM
ldx #0 ; IOCB #0 (E:)
lda #63 ; set buffer length for max
sta icbll,x
lda #0
sta icblh,x
lda comtab ; store COMTAB+33 at icba
clc
adc #comfnam
sta icbal,x
lda comtab+1
adc #0
sta icbah,x
lda #write ; 'print string' command
sta iccom,x
jsr ciov ; print it.
jmp mainloop
exit
rts
crunch
jmp $FFFF ; will be changed by INIT routine
*=$02E0
.word init ;run vector
```

I remembered seeing at Cartsten Strotmann's site some Action routines
for reading the SpartaDOS command switches Hope the routines contain
all the information that you are looking for.

http://www.strotmann.de/twiki/bin/view/APG/ActionSpartaDosParameters

Seems the routines were writen by a Bill Aycock and he cites pages
108-111 of the SDCS manual for further reference.

This all that I have ever seen on this subject.

Umm... ok. When you enter a command in SpartaDOS, DOS XL, and... OS/A+ (I
think), the string gets stored somewhere in memory. Most of the time, the
only part that really matters is the first word, whether it's an internal or
external command/filename. In the case of an internal command, like, say...
DEL, MKDIR, CD, whatever, it's a command that's built into SD. In the case
of an external command/program, you can pass parameters to the program you
call from the command line if you know where in memory to look.

Most handy for writing utilities and stuff of the like.

Source record: 6793

You can grab http://www.magelair.com/Atari%208-bit/psidisk.arc from my site. It has all the source I could salvage for my old RAMDisk program, including the SDOS.ACT file for talking to SpartaDOS (like commandline parameters). There's a few source files missing, but nothing that should be critical for your needs. I think you're just needing to see SDOS.ACT and how it's used.

6737. FA: MyIDE+Flash Cartridge for Ataril XL/XE - Price lowered!

From: Tom Tom <sometomtom@tomtom.com>
Message-ID: <H3lcg.5047$qn2.4923@trnddc04>
Source record: 6795

Just wanted to share with the group here a document that I updated yesterday on the 1400XL/1450XL computers regarding the voice handler. John Hardie years ago (back in 1990) released a document describing how to use the voice handler on these machines. But at that time, with limited information available from Atari, there were a lot of unanswered questions about how to use it exactly.

Atari Museum (http://www.atarimuseum.com) in recent times posted scan documents from Atari's archives. In the 1400XL section of the site is a document detailing the voice handler. I recreated John's original document and added an addendum based on this new information. You can find the new document on my website (http://members.fortunecity.com/atarishowroom/) in the 1400XL section under SELFTEST & SPEECH.

Also recently unearthed is information on one of the MMU gate array's used in the TONG version of the 1450XLD. Curt Vendel of Atari Museum unearthed a document on Carmen (MMU gate array B). The document has the boolean logic formulas that explain the inner workings of this chip. Now if the document can be found on the other chip (MMU gate array C) then replacements of these chips could easily be designed. This document and others can be found in the 1450XLD section of Atari Museum.

Enjoy.

Glenn

Are you sure that this is the correct Weltec model number, and likewise
that it really is a 360K drive? The Teac model that you list is a 1.2
drive (not 360K). A 1.2 drive may give problems due to its R/W head
being narrower. Other than that, I could only suspect alignment issues
on copy-protected disks. -Larry

6744. 'AFTL-FAQ' .....PEDOPHILE TERRY ORTMAN HEADED TO JAIL!

I'm just glad I viewed it in a semi-safe browser. More pops and attempts at downloading code than you could wave a stick at. Total nightmare.

Iain

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hi,

I have a disk that has become corrupt in a file that I need to
retrieve. I would like to retrieve it up and to the bad sector if
possible. Was there a utility that could read the tokenized basic from
the disk so I can retrieve at least part of it? It was called Basic
Recovery something and may have been in Antic, Analog or Compute!?

Any ideas?
Rory

OK, if it is a file on a DOS 2/2.5/MyDOS disk,
you could use Disk Wizard II to see where the
file sectors are, and which is the bad sector.
You might even be able to recover the bad sector.
Since it is a SAVEd file, it may be difficult to
retrieve just part of it.
OK, after you know which are the sectors,
you can use a program to dump sectors to
a file (I have such a utility). If you're lucky and
only one bad sector is there, you might be
able to append the two files you make.
Then, finally, there's Jindroush's pc utility
called 'chkbas' I think, that might be able to
detokenize the file.
Just some ideas.
Russg

OH, if you dump the sectors to a file(s),
you'd have to remove the bytes at the
end of the sector containing sector link
data. I forget exactly what those bytes were.
Three bytes I think. The next sector in
two bytes and another byte.
You could use a BASIC program to read
125 bytes and write them to another file,
then read and discard three bytes, and
so on, to end of file.

6752. Memory Locations of XEGS roms?

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-25 00:57:57 UTC
From: nomorespamever@yahoo.com

Source record: 6709

Hello, i was just wondering if anyone knew the location in memory that basic (8k), the os (16k), and missile command (8k) can be found at on an Atari XEGS. i realize on the other 8-bit ataris basic can be found at A000-BFFF and the os at C000-FFFF.... is it the same for the XEGS? i've heard that the locations are different? is this true? also, does anyone know the location in memory of missile command?

i've been searching on the internet and all i could find was a book on the Atari Memory Map published in 1984, which i'm guessing is outdated since the XEGS was released well after that. so, any help would be greatly appreciated as i would like to copy my XEGS rom using my SIO2PC cable. thanks...

That is a complete set of separate Antics, 88 or 90 of them,
not sure. There were 4 issues of Antic inserted in the last
4 issues of STart that might be included as 'Antics'. I'd guess
it is a good dollar each, for the ones after about the 15th or
20th Antic, you can probably get more for a set of the first 10,
if you sold those separately. But, Good Luck.
Complete list of Antic Magazines

Antic began publication 4/82, Volume 1, Issue 1.
They were bi-monthly for the first Volume, six issues.
Starting 4/83 (Vol. 2:1), Antic became monthly.
They published monthly until 9/89, missing only one month
(5/84), making the volume year end with April issue instead
of March issue. That's 65 consecutive monthly issues from
2:1 to 8:5.

Starting 10-11/89, Antic became bi-monthly again (issue
8:6), and were bi-monthly for only 5 issues. Volume 8 only
had 8 issues. 10-11/89 (8:6), 12-1/89-90 (8:7), 2-3/90
(8:8), 4-5/90 (9:1) and 6-7/90 (9:2), <-- the last issue of
a separate Antic. There was no 8-9/90 Antic. Then Antic was
put as a section of STart magazine for 4 issues (10, 11, 12,
1/90-91). Then STart, still with an Antic 8-bit section,
went bi-monthly for the last 2 issues (2-3/91 and 4-5/91)
then STart folded and that was the end of Antic and STart.

List of Issues/Volumes:
Vol. 1 - Six issues (4-5/82, 1:1) to 2-3/83, 1:6)
Vol. 2 - 12 issues, all monthly
4/83, 2:1 to 3/84, 2:12
Vol. 3 - 12 issues, but no 5/84, so Volume year now ends
April instead of March.
4/84, 3:1, (no 5/84), 6/84, 3:2 to 4/85, 3:12.
Vol. 4 - 12 issues, 5/85, 4:1 to 4/86, 4:12.
Vol. 5 - 12 issues, 5/86, 5:1 to 4/87, 5:12.
Vol. 6 - 12 issues, 5/87, 6:1 to 4/88, 6:12.
Vol. 7 - 12 issues, 5/88, 7:1 to 4/89, 7:12.
Vol. 8 - 8 issues.

5/89 (8:1), 6/89 (8:2), 7/89 (8:3), 8/89 (8:4),
9/89 (8:5), then bi-monthly 10-11/89 (8:6),
12-1/89-90 (8:7), 2-3/90 (8:8).
Vol. 9 - 2 issues.
4-5/90 (9:1), 6-7/90 (9:2) <-- Last issue of
separate Antic. No 8-9/90 Antic.
Then Antic was put as section of STart magazine for 4
monthly issues (10, 11, 12, 1/90-91). Then STart went
bi-monthly (2-3/91 and 4-5/91) <-- Last issue of STart with
Antic section.
That's 94 issues total, including issues in STart, 88
separate issues of Antic.

I have wished for a utility such as this several times, but I don't think you can do much with software beyond recovering/detokeninzing the file up to the bad sector. There are many Basic detokenizer programs, but any that I've seen just quit when they get to a missing section of the program. If you really want all the file, you can very likely detokenize the last part of the program by hand using the info in De Re Atari, etc. after finding the rest of the program on the disk. If you're lucky, the file is contiguous. Obviously a lot of work. If you do find a "magic bullet" won't you please post what you found? -Larry

Please post more information on how the testing
has been done.

Also, does the device analyse both sound and
the chemical contents of the air?

> an Atari XEGS.

Most likely: 0xa000-0xbfff for Basic,
0xc000-0xcfff, 0xd800-0xffff for the Os (*)
0xa000-0xbfff for missile command.

The XEGS is just an ordinary 8bit series inside AFAIK, thus nothing
special about the cart locations.

(*): Well, this is only half-way correct. The Os ROM also carries
data between 0xd000 and 0xd7fff, but that part is not visible there.
Instead, the mentioned memory locations map the IO space of the
custom chips. However, by bit 7 of PIA port-B, this address range is
mapped to the memory area 0x5000-0x57ff and can be read there.

So long,
Thomas

First thing is to recover the file from the disk. Most files
are sequential sectors, not always. You can use Disk Wizard II
to trace the sector links. Actually, a relatively good disk may
be able to recover the bad sector with Disk Wizard. Try another
disk drive also, and try to read the bad sector several times,
you may succeed in reading it. I always re-wrote such sectors
to the original sector, but it may be better to write the sector
to a known free area, like maybe sector 650, (about 700 is
problematic, especially with some drives and disks).
Rory might do a number of things with the disk, like map
the disk for the bad sectors, follow the sector links.
I only know of my own utilities to dump sectors to a file
and mine and Jindroush's detokenizer programs, if I remember
I found my Atari detokenizer to be more robust, ie. may get
past a corrupt area of a SAVEd file and be able to finish.

I double-checked the disk drive mechanism, label shows model: WI-360-12. 360 means 360K disk drive.

you sure about Teac ? I ordered Teac 360K drive long time ago, the store send the wrong one. Anyway I have Teac 360K and Teac 1.2MB but I noticed that there are different busy light colors, red and green. 360K - red and 1.2MB - green. that s what I thought.

Thanks!
Jack

I believe what you're looking for was in ANALOG 29,
April, 1985. A program called REVIVE, I got it off of
Holmes atr for that issue, but that file was corrupted.
So, anyone have a good version of 'REVIVE' I believe
it is a BASIC program, but may not be.
All the archives I searched didn't have that issue.
And it is past my bedtime.

I assume that english is not your mother tongue, as your posts are very difficult to understand.

Anyway, the automobile has undergone significant changes since its invention. We have electric starters now -- gone are the old crank start engines. Automobile tires are no longer made of solid rubber -- inflatable tires offer a much more comfortable ride and require less maintenance. In recent automobile history, there has been significant improvements as well. Current automobile designs are more aerodynamic and offer less drag, thus improving fuel economy. It really wasn't so long ago that car designs were very boxy and fuel hungry.

Computers have undergone a similar evolution albeit at a much more rapid pace. Where computers used to require less electricity to operate, their functionality was greatly limited. As computers improved in functionality and their spectrum of use increased, their power requirements also increased. At the present time, performance growth is slowing and conservation factors are increasing -- meaning that energy requirements are being reduced and the over-all form factor is decreasing, while still offering significantly greater performance.

The trend in products that have staying power, appears to be as such: Primary focus is performance and quality, with secondary focus being economy. Where the Japanese invasion brought economy to the automobile

market, many computer and computer component manufacturers are bringing economies to the computer marketplace. The days of quantum leaps, at least as far as technological performance is concerned, are pretty much over for the computer industry. Now, vendors must focus on other means of selling new technology, and this invariably means that they have to offer more for less, or as AMD is currently doing, sell consumers on the prospects of energy efficiency.

Of course, I'm just an idiot and really have no idea what I'm talking about, so my little diatribe should be taken with a grain of salt.

The OP seems to not be around.
I found that the REVIVE programs and executable are not
corrupted, just I don't know what it does. It is from '84/'85
so I don't think it is a command line program. I'd have to
have the magazine to see what it does and how to use it.
The disk has the BASIC program that writes the executable,
a M65 source code, that is tokenized, and a copy of the
212 byte executable.
Anybody got issue 29 ANALOG?

hmmm. The P3 I am using needs the same power (watts) as a 486/66 but is
much more faster and mutlti-processing capable (many tasks...). That's
a quantum leap for me, although the 486 is pretty fast too.

Analog Scan 29, pg 57 column 1
[Start Scan]
What happens when you delete a disk file?
After processing the filename, DOS searches
the disk directory for a match. If the file is
found, DOS sets a bit in the directory entry
indicating that the file is deleted. Then DOS
reads each sector in the file, finds it in the VTOC,
frees it for re-use and increments the free sector
count. The directory search continues for the next
match. If one is found, the process is repeated until
no further matching entries are found.
How it works.
You've probably already figured out how Revive works.
The program simply reverses the DELETE process.
First, the DOS directory search routine is instructed
not to ignore deleted entries when testing for a filename
match. When a match is found, the file is restored to
active status. Then, each VTOC sector bit for the file
is reallocated as each sector in the file is read, and the
free sector count is decremented.
Revive has one important limitation. It cannot reliably be
used if any data has been written to the disk after a file
was mistakenly deleted. The reason is that some of the
sectors freed when the file was deleted may subsequently
have been allocated to the new data file. Revive may then
also assign these sectors to the rescued file. [End Scan]

```
From DOS option M: rerun the program at address 179F
ELSE E477 to reboot.
```

The type in just seems to make a DATA statement dump to D:revive.
Just a lot of reads and puts and data lines.

Thanks for that, Roy. I see it is an 'undelete' program.
I ran it from MyDOS and didn't see any results (ran the
executable that the BASIC program creates).
Well, it isn't what the OP wanted, and not what I thought it was.

There is an undelete program for SpartaDOS, and there's
an undelete in Disk Wizard II for DOS 2/2.5/MyDOS disks.
I still think this may be the program the OP (original poster) had
in mind, as the article full title is: 'Revive: A Disk File Recovery
Utility'.

The article mentions that you use DOS 2.0 because of the menu's
and the ability to jump from the revive menu to DOS 2.0 menu
via M: run at address. 179F Jumps back to DOS 2.0 menu.

Somewhere there is posted a diskette repair method that will revive some
disks.
Like taking the disk out of the sleeve and washing the plastic disk and
replacing
after drying in a new clean envelope. Keeping side one always down....
Look into the Atari FAQ's -- I think it is online at www.atarimax.com

Does it? Does your P3 use the same amount of power as your 486/66 processor? You may be using a 300 watt power supply, for example, in both machines, but that does not necessarily mean that both machines are using the same amount of power. There is a very real distinction between the amount of power available and the amount of power actually used.

I will scoot on over to Intel's site and look for power consumption information for their various processors. I'll report back with my findings.

>
> Well, when comapring crank-arm starter and such things, you see it
> obviously from an other point of view.
>

That was the gist of my opening comment: your posts are difficult to understand. The point that I was attempting to illustrate was this: All product families evolve in much the same fashion. Allow me the opportunity to elaborate.

When the automobile was first invented, it was dismissed as irrelevant, impractical, and unworthy of consideration. The prevailing means of transportation at the time was the horse, and very few people saw any reason to leave their horses and buggies behind in favour of this new fangled contraption dubbed the automobile.

Likewise, when the personal computer was invented, it too was dismissed as being irrelevant, impractical, and unworthy of consideration. At the time, computing was done on much larger machines and there seemed no reason to suspect that the average Joe would have any need or desire to own or use a personal computer. Pen, paper, and the human mind were the prevailing "personal computers" of the time.

Just like with the automobile, the personal computer developed a small niche following and gradually blossomed to the point where everybody and their brother was either manufacturing automobiles or manufacturing doodads to improve the automobile.

As the automobile gained popularity and acceptance as a viable mode of transportation, much of the competition in the automobile enterprise evaporated to the point that there were few remaining manufacturers. Some of the early automobile manufacturers simply went out of business, while others merged to form even larger dominant automobile companies. The parallel in the personal computing sphere is so obvious, that I'll not bother to delve into the matter.

Anyway, as time went by, there grew a general understanding of what an automobile is and should be. Basically, there came about a set of standards that everyone in the automotive industry tended to adhere to. Gone were the days when redefining the automobile was practical or profitable. Again, the parallels to the computer industry are very obvious.

I guess what I'm trying to say is this: They created the car and stood around saying to themselves, "What now?" And I think that's where the personal computer industry is at right now. Only the automobile industry took much longer to get to that point than than the personal computer industry did. And just like with automobiles, personal computers evolved from being big clunkers to cute little devices that went faster, required less technical knowledge, and became "must have" items.

The automobile manufacturers answered their "What now?" question by adding creature comforts to their cars. The computing industry did the same thing. The automobile industry began to compete more on price as the technological advances began to slow. The computer industry did the same thing. So they really are quite similar.

As we have seen advances in automobile engines, we have seen advances in computer processors. As we have seen creature comforts like automobile entertainment, etc, we've seen creature comforts in personal computers with the multimedia boom of a decade and a half a go.

What was your perspective? In english?

>I use Atari 1050, and XF551, FSII and Conan worked prefect! Any reason why
>Weltec doesnt work wtih FSII Boot and Conan?

I hope this doesn't muddy the issue here, but I wonder if this is related to
this bit I have in the FAQ regarding the XF551:

Rotaton rate: 300RPM. Since all other Atari-specific drives run at 288RPM,
this results in rare compatibility issues. Specifically, these commercial
disks do not load in, and can be damaged by, the XF551:
- Flight Simulator II (subLOGIC)
- Blue Max (Synapse)
- Bank Street Writer (Broderbund). Conflicting reports about this one.

Of these, I have experience with several original Blue Max disks, and two
XF551 drives. I found that trying to boot Blue Max with the XF551 would
result in the disk literally being destroyed by the drive. The drive somehow
"scraped" right through the media, so that there was an obvious ring where you
could see right through the disk. Don't ask me how that's possible, but I
wrecked two or three Blue Max disks that way!

Snip about REVIVE from ANALOG 29.

OK, I figured how to run it. I believe you have to have
the 'MENU' file on a DOS 2.0S disk, and run the binary
'REVIVE' program, it changes the 'D' DUP.SYS to
REVIVE, and prompts for a filespec, then undeletes
the filespec. I don't know if you can use wildcards.
This isn't what the OP wanted, but may be what Rory
was thinking of. He seems to have disappeared.

Okay, here's a link to a chart showing power consumption for some recent processors. These are AMD and Intel processors.

http://www.tomshardware.com/2004/06/19/intel_stakes_its_vision_of_the_pc_future_with_775_launch/page50.html

Here's an article about processor power consumption from the gamePC website:

http://www.gamepc.com/labs/view_content.asp?id=lpcpuso&page=1&cookie%5Ftest=1

Here's another article from the PC Guide website about processor power consumption:

http://www.pcguide.com/ref/cpu/char/power-c.html

And finally the processor power consumption review available at this site:

http://www.silentpcreview.com/article313-page1.html

There's a whole boatload of articles and benchmarks on the Internet that show how power consumption has increased over the years. I even went to one site that featured a half-bared female breast (nipple covered) and a discussion on power consumption. I decided not to post the url for that site, though I imagine you could find it just as easily as I did... If you're so inclined.

In English. Erm..

You write very good English....

A bit from the observer point of view. I like to be active inmidst all happenings on our world.
My dear, I know (saw) people who do not even change their clothes when going out for some cigarettes.

A car gives you a feeling of security, no animal (I am not in Africa), no human can damage it so easy (especially not you, who's inside). And the compensation is given by the other car-traffic participants.
Contact with people (johnie Walkers) is not in demand - they are weaker. No, they get hooted by 'auto'-horns.

No no, there are no parallels.

Compare the 79' ATARI calmness with an actual Computer in the same pricelclass as in that time!! [For an ultra-silent you pay almost the same amount more, just for the passive-case.]

...I mean a fast Compy with Ultra-GfX and a little faster CPU than the usual standard (1.79 to 1 ratio, I do not know in NTSC).

Compared to a 79' Opel Rekord (4Cyl, 2litres, 8valves) and a 2006 Opel (4Cyl, 1.6/1.8litres, 16valves). Hmmm? Does it sound in your ear ;-)

Hey... that's totally opposite. In all variables I have given so far.
And without crank-arm starter :)

Kind Regards,

Daniel Mandic

But farts are like snowflakes and fingerprints: no two are the same.
Besides, I know of very few people that are able to fart on-demand.

Although such a device would have considerable potential in eliminating the
dreaded "who smelt it, dealt it," situation. Seems the dealer tends to
remain silent while the vocal victim gets all of the blame. So this would
be one application for a fartalyzer.

I think with the Atari 8-bit, you have to save the string data to a separate file. I think it was only the Apple (could the Apple save string data with the actual Basic program?) computers that could save string/array data with the Basic file.

Besides, isn't Atari Basic incapable of doing string arrays? Ah, that must be why you used the slash to imply strings and/or arrays... No?

Rory;

Revive from Analog 29 is simply an undeleter and does not do what you need. I have not ever seen a utility to salvage part of a SAVEd Basic file; if the Jindrosh detokenizer can send output to a file it could recover code before the bad sector. The other options are to adjust the offset tables to end the program at the bad sector or patch around it with some dummy data like REM statements to fill the gap. Either way you will need a good sector editor to tweek the changes. Do we know you have a bad sector? Which error message do you receive attempting to Load the file or copy to another disk? Can you make a sector copy of the disk or an ATR?

Jess

The sinclair computers (ZX80, 81, TS1000 & TS1500) saved all variables
and even the display when programs were saved to cassette. When you
loaded the program back, if you did a Goto you would be able to get
back in the program with all variables, run would clear them. The
screen was aytomatically cleared out but was still loaded (kinda
quirky).

That sounds about right. Newer processors run hotter... Heat requires energy... The more heat that is dissipated, the more energy that is used. It's a pretty simple follow through... Newer processors run hotter, therefore they use more electricity. Just like a higher wattage lightbulb will get hotter and use more electricity than a lower wattage lightbulb.

A car gives you a feeling of security? In what sense? Nearest I can figure, a car would give you the ability to escape a walker that could do some serious harm to your ass. Other than that, a car provides no additional security for a driver than a pair of shoes provides for a walker.

Quite honestly, I would tend to guess that cars are less secure and more prone to hazardous situations than walkers are. Especially if the driver is drunk and/or an imbecile.

This makes absolutely no sense. Are you saying that Atari computers from the seventies ran quieter than todays computers? Well, duh! The old Atari computers had no moving parts. Read: No hard drives, no fans, no CDs or DVDs, etc.

The old Atari computers did offer optional floppy drives, but floppy drives only make noise when they are being read from or written to. The floppy drives made absolutely no noise while idle, just as modern floppy drives in modern computers make no noise when idle.

I've honestly never seen an Opel. I can't even recall having ever seen a picture of one. I know absolutely nothing about Opels.

Hi AlbaClause!

In short... I mean a new car is more silent than an old, and it is more
efficient. That's totally opposite to the computer development, IMO.

Say what you want, I like the 8 bitters from various points of view.
ATARI for the nice broad smooth graphics and his unique Sound, the
Sinclair for its High-Res and the unique Atmosphere, the C-64 for the
slow Disk-Drive and the brilliant ZX81/TS1000.

Best Regards,

Daniel Mandic

6800. Re: A BASIC String/Array Question

Newsgroup: comp.sys.atari.8bit

The creators of Atari BASIC didn't intend that one would be able to save String or Numeric Array (/) data other than in program lines (e.g. 100 S$="abcdefg..."). But some clever persons looked at how BASIC decides what to SAVE and tricks BASIC into saving beyond the normal end of the program. I found a reference to it in the the Atari BASIC Source Book (Compute! Books), page 139. Like with virtually all systems, programmers have discovered all kinds of tricks to do with A8 BASIC. How about binary loaded BASIC programs?

No, Atari BASIC can't do string arrays. It's fairly easy to simulate string arrays, but it can't do them directly. That's one reson that I really prefer Basic XL (and XE) over Atari BASIC or even Turbo BASIC. Although TB is a very close second.

Turbo Basic was my Basic of choice. I was keen on the compiler, and the
ability to get disk directories quickly and easily within Basic was a plus
as well. There were other reasons for my liking of Turbo Basic, too.
Although it's been a while since I've done anything with it.

New computers are much quieter and more efficient than older computers, if you compare apples (the fruit) and apples. If you consider the noisemakers of the older computers (old disk drives, etcetera) they were much louder than those found in newer computers. Try comparing an old Atari 810 or 1050 to a modern 3.5" disk drive.

If you consider the amount of electronic components required in older computers to do very limited tasks, and you compare the amount of components in newer computers, that are capable of performing a much broader range of tasks, you will find that newer computers are much more efficient.

Newer computers only become inefficient when they are more computer than you need. I think that's really the key. The Atari 8-bit computers are not more computer than you really need. Modern computers, in most respects, are more computer than most people need. When you're running computers that can do more than you'll ever need them to, you're going to be experiencing some inefficiencies and higher than necessary operating costs.

Case in point:

I have an old PowerMac 9500/200 that I'm running Linux on and using as a fax server (for a little project I'm doing on the side). It's an old computer, underpowered by today's standards, and still under-utilized.

Basically, I have a computer that sits around and waits for me to send fax jobs to it. While idle, it uses less than 10% of it's total processor power. And this is with an Xserver and Xclient running and Gkrellm constantly displaying what's happening.

To make better use of the 9500's resources, I made the hard drives an NFS fileshare so that I could take advantage of the 9500's disks from other machines on my network. But my 9500 was still under utilized.

I'm building a website for a little project that I have on the side, and I figured that I could utilize some more of the 9500's resources by making it a mySQL server for my website. So I did. And while I haven't really done

too much with mySQL yet, my 9500 is still very much under utilized.

I installed xmms on the old 9500 and accessed my mp3 files, which are
actually stored on the machine that I use as a webserver, and my 9500 is
still under utilized -- even though it's cranking out mp3 tunes.

Now, there are tasks that the old 9500 is not particularly well suited for,
like video playback, for example, but I'm really finding it difficult to
fully utilize this old machine otherwise.

When you're talking about power, the kilowatt hour is the only measurement
that matters. Hydro companies bill you by watts -- not volts.

What broader range of tasks? (electric circuitry?... autotrax? 386!!)

When I turn on my TV-Set, I have Video (deep, colorful, smooth animated
electric pictures). When I take a book I have middle- or large-format
scale taken photographs, reproduced. And all much faster, more reliable
and in better quality than a PC and a 256-coulour-shaded digital256 LCD
TFT 6ms-Fast can support.

You want compare google-video or such, to a beta-quality Tapes
outfitted TV-Station, sending in 16:9? Or a iP4 VS a high-end
DVD-player in picture and sound quality?? hehe :-)))

[Or a micro-pci soundcard with mickey mouse-connectors vs a 40 pound
high-end CD-Player]

Please show!

Ok, here the scenario.

A long time ago:

I had modified this one basic program to reduce the file size from ~64 sectors to ~54 sectors. The disk has been in storage for a while. The status of the disk was unknown to be at the time of storage until I dug it out. It may have been damaged before storage.

A couple of days ago:

Couldn't run or the file. The file would seem to load, except I got 2 READY prompts and not able to 'LIST' it. I then had to find out why the file was not loading properly.

When I ran a file trace from Diskey, there were only 53 sectors in the file. The file was not contiguous. I searched each sector for the lost sector. It was not found. I tried to patch the VTOC to reflect the new but incorrect sector count. It is not a bad sector problem, but a FMS or VTOC corruption.

The file is not super critical, but would have liked to see what I had done. If I could find a program to parse and to redirect the file to a text file would fit the bill.

I will check the De Re Bible and see if a utility to be written is in order. The disk is a MyDOS 4,x which might be a DOS 2 variant.

Probably a BASIC version B problem.
You can use Jindroush Kubic's 'chkbas' program or my
'SALVAGE' program. I don't think it is a disk problem at all,
could be wrong, but it wouldn't hurt to try the salvage or
chkbas programs. And let us know what happens.
Will send in e-mail.

MyDos 4.xx is 2.0 file and disk structure compatible; but patching the VTOC just prevents future disk write problems. Updating the directory info might help the load situation... I do not remember what all could cause that double READY symptom. First thing I would do is compare the file size to the pointers in the file's first sector as it looks like Basic
has lost where the end of the statement table is; does it lock up when you attempt a LIST? Any chance someone did the old POKE(PEEK(138)+2... unlistable trick? Does the file's last sector contain text like
D:FILENAME.SAV and fewer than $7D bytes?

e-Mail me an ATR or DCM of the disk if Detoken and Salvage are not successful.

Jess

I've heard this complaint before, and then others seem to be
able to access it fine. The URL you quoted, with the
russg.. instead of the full URL results in an ERROR.
I don't know what is going on. Are you sure you're not
having a word wrap problem?
I tried to access the page with someone else's computer
and it did fine. You get the page, and a 'welcome guest'
at the top and you see a My Documents folder.
you click on that folder to see the files.
I dunno.
Just in case you want to try again:
http://briefcase.yahoo.com/russgilb@sbcglobal.net

Buried bucks, a helicopter picking up treasure items, possibly
dollar signs, from the deep. Large blue background playfield and
a yellow helicopter. Smooth movement, simple, but fun to play.

I feel tempted to check by searching the web for screenshots, if
I am correct about how the game looked.

6817. Advan BASIC to be released as public domain

Newsgroup: comp.sys.atari.8bit
Date: 2006-05-30 16:01:14 UTC
From: Rory.A.McMahon@gmail.com
Message-ID: <1149004873.954723.170180@r44g2000cwb.googlegroups.com>
Source record: 6674

Hi all,

I have been working with the author of Advan BASIC (William Graziano)
for the last couple of months in preparing the release of Advan BASIC
and the utility disks for public domain. I will be looking for a few
hosting areas for its release sometime this week.

The release will include:

1.) Disk images released for real or emulated Ataris.
2.) Documentation available in plain text, PDF, and M$ Word.

I have a few stipulations for web sites. I will be asking William for
other stipulations, but these come to mind. Just a straight forward
easy webpage will work. If you need an example see:

http://fujiman.no-ip.com/Advan/Advan.htm

We may add a comment area from the author, and other links...

1.) No pop-ups
2.) No advertising
3.) Atari browser compatible site.

I think we will also have a release competition to see what creative
minds can create with Advan BASIC!

Contact me for questions or information.

Thanks,
Rory

I never played buried bucks but i know it was in my collection (with about
400 others).

I liked necromancer but found it weird and never really figured out what the
point was.

How about ftp sites and BBSs? ZERO worry about pop-ups or advertising
here! :-)

Ah... OK. I don't know what is happening. That briefcase
is supposed to be publicly accessable. There isn't any
password or 'not allowed' that I'm aware of, but you are
getting.
I guess you tried it again. There's nothing I can do.
I can e-mail it to you if you like, and your ISP allows .zip
and .arc attachments, which McMahon's ISP didn't allow.
OK, I'll e-mail them, here they come, ready or not.

I just tried it with Mozilla 1.4, Firefox 1.0.4 and lynx 2.8.4 under
Linux and it works fine.

Maybe the problem's caused by a broken webbrowser and/or proxy
that gets confused by the "@" or so.

so long,

Hias

Hi Rory-

Great! Good job!

Any chance that Mr. Graziano will release the source code? I bought
all these years ago (copy-protected disks), so hopefully these images
will be ATR's and not PRO.

Larry,

William has asked me not to release the source code yet, but the disk images will be in ATR format. That was the main objective of getting Advan off the copy protected disk and on to a flexible format for laptop/portable 8 bits! Now you can code some cool stuff on the road!

The PDF's are scanned from the manual, the text was then OCR'd (There will be a few typos and missed editing) and then brought into Word.

I also had bought the entire suite from Advan Systems when I first saw it in Antic & Analog. I believed it cost around $100 plus shipping. I've had fun with it. It has everything for a BASIC development kit.

Thanks for trying it also, Roy.
It may not be clear what these (salvage and chkbas) programs do.
If Rory's BASIC file is truly on a bad sector disk, then he can't
copy the file very well, meaning he can't get the file off the disk and
on to a PC directory for chkbas to be run on.
My salvage program, on the other hand, will retrieve the BASIC
program off the disk, as it must read from a file on disk. I'm pretty
sure salvage will trap on error sectors, so at least up to the
error sector will be retrieved. Just in case the salvage program
errors out and exits with an ERROR xx message, it would be
necessary to close the writing channel to save what had been retrieved.
Just a CLOSE #1:CLOSE #2 would do, but I think
it traps and automatically does that.
I suspect that the entire BASIC program can be salvaged, but
if there really is a bad sector, it would require some sector dumps
and appending to the first part of the file to maybe be able to
retrieve more of the program.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Was the NTSC XEGS cartridge release in color? i remember this being in color but I can't find my cart at the moment and the rom dump I have is B/W in both the atari++ and atari800 emulators. is this a problem with my rom dump? the emulators? or is it that *my* memory is failing me and it really was in B/W?? any help on this issue would be greatly appreciated. in the meantime i'll keep looking for that cart... it's gotta be here somewhere! :-)

mark.

Just a guess but the game probably relied on artifacting for color.

You can enable artifacting in either emulator.

yup, that was the problem... is there a reason that you would _not_
want to turn on artifacting in either emulator? thanks
```

It's up to you whether you leave artifacting enable/disabled. However,
artifacting is particularly ugly in Graphics Mode 0 (as in BASIC). For
text clarity you will probably choose to leave artifacting disabled.

Most games don't use artifacting and those that do are pretty obvious,
as was the case with David's Midnight Magic.

I suppose, if you want to get technical, Bravo Sierra Computers isn't really an adoption agency, as adoption agencies typically don't sell their adoptees. Perhaps Bravo Sierra Computers would be best described as an Atari Pet Store. A place where you can buy your favourite Atari pets. Although it would probably be even more accurate to describe BSC as an Atari Humane Society -- A shelter unwanted and stray Atari computers and peripherals.

I suppose if you were feeling particularly insane, you could refer to a garbage bag as the Dr. Jack Kevourkian of Atari Computers. And I suppose that would make garbage pickers radical activists that oppose euthanasia.

Hmmm, so what would that make Jack Tramiel? A Doctor Morgentaler? Yeah, I guess it would. That would make Jack Tramiel the man that performed abortions on countless Atari computers in their first trimester.

Hmmm, following that logic, Nolan Bushnell would be the father that walked away from his bastard child before it was born. So Warner Communications would have been the single mother who raised the 400, 800, and XL machines on welfare before abandoning the children at the Tramiel orphanage.

Wow! So dirty old Jack fathered the XEs and had a vasectomy. So Jack Tramiel wouldn't have been the abortion doctor after all. Rather, he was the man that decided XEs would be his only 8-bit children.

Crazy? Yeah, but don't tell anyone. It'll just be our little secret, okay?

As one who has adopted, it ain't free but it is a great bargain! (talking human folk here).

But when it comes to Atari computers, did go through a few, a 1040ST, a Mega ST4 and a couple of STe Mega 4s. Install a program, just a folder with a two or three files.... to remove the program, delete the folder. But now I've advanced to Windows XP Pro and to install a program, 30 or 40 megabits scattering files throughout the hard drive(s) and to remove it... it ain't gonna happen, there will be stains left until the drive is reformatted. But, it's progress! It was basic MREs but it sustained life. <G>

All have a good day.

Hello All,

I have new batches of Atari 800/XL/XE to SCART or RCA cables. These are currently being sold on eBay at a fixed price. Link is:

http://search.ebay.co.uk/_W0QQsassZdeangarraghty

Before anybody has a moan, yes I know people could make these cables themselves. But, there are many who can't for whatever reason.

Back in the 80's there was a game that I typed into my 600xl & tape drive (pretty sure it came from Compute!). It used graphics 0 and was a character based puzzle game. You had two windows on the screen, the one on the left showed a pattern of characters (mostly / \ - etc.) and you had to make the right window look like it by moving up and down to select a line and then left and right to scroll the line till it matched what was on the left. There was a timer on the game. Does anyone recall this game?

If I'm not mistaken, I believe I have the Compute! issue containing that very game. I'll have to look through my old magazines to be certain, but the game you describe does sound very familiar.

I think this is the issue / game:

Compute! Issue 31 - December 1982
Hidden Maze (multiple computers)

The time is right and I remember the issue before it with the laser
blast game. Unfortunately Atarimagazines.com does not have any text for
this issue.

It would have to have come out before October 83 cause I met my ex then
and stopped using the computers for a few years.

Sorry, my earliest issue of Compute! is 65. Which is the October 1985
issue. Man, that was a long time ago. I would have been in grade seven in
October 1985, so 1982-1983 would have been before I developed an interest
in computers.

Anyway, I'll look through the issues that I do have, and see if there was a
reprint of the game you mentioned.

I found the game that you mentioned: Hidden Maze - Compute! - Issue 31

You can download it here:
http://www.atarimania.com/detail_soft.php?SYSTEM=8&menu=XL&ADV=0&VERSION_ID=11660&SOFT_ID=
10455
```

But this game doesn't look at all like the game you're describing.

Your right - that isn't it. I am pretty sure it was compute!, I don't remember another magazine at that time that had type is for multiple computers, and I remember that there was other versions of the game besides atari (ie commodore, ti99 etc).

Hi NG

I have started one of my rare games with a blue Player (I can count
them on one hand). Thinking to Heaven.... it's also blue.

And it was, heavenly. A totally satisfiying game with many exciting
events.
Without supporting the CPU-Player it is not so easy to heft the colony
beyond 100,000 points. But I have been the First Founder, and the
Colony ended with 104,939 :)

Best Regards,

Daniel Mandic

erm... well.

I meant M.U.L.E. (C 1982, Ozark Software, ATARI 400/800)

I cannot praise this game too much.

Well, let's see. There was Puzzler in the November 1985 issue of Compute!. It is similar to the game you describe, though it uses color blocks instead of the "/" and "\" characters and it definitely doesn't use graphics mode zero. Aside from that, it draws two boxes on the screen and your task is to match the pattern in one box to the pattern in the other. There is a timer at the bottom of the screen.

That's the only "type-in" program that I could find in my back issues of Compute! that even remotely resembles what you describe. Remember though, that my earliest issue of Compute! is October 1985.

For some reason I do recall having seen or played the game that you describe, if somewhat vaguely, I may have encountered such a game on one of Compute!'s many compendium disks. Or possibly as a file contained on a disk of some long gone Atari public domain library?

Just looked through all the screen shots on atarimania and didn't see
it. I may just rewrite it myself, I can remember what it looks like and
how it acted.

And if you use an Atari emulator on a PC, you can play M.U.L.E. over the Internet against other folks. Check out this link:
http://atarimule.neotechgaming.com/index.htm

Funny, I don't recall having ever played M.U.L.E. in days gone by. Wonder if I even have this game in my collection?

Yes, I know.

The Homepage is still there.

Seldom. I have the code for mule online but forgot my user-name. I thought to find it in older posts in the forums.

As I suggested all deleted... Seems there are turnovers every week or month.

Best Regards,

Daniel Mandic

Could it be "Mosaic Puzzle"?

I see a reference to Compute!, issue 41, October '83, for this puzzle program in www.Atarimagazines.com's master Compute! index but the article text is not available.

Sounds like the right time period - I did some seraching and found the
64 version of it in the Dec 83 issue (this page:
http://www.atarimagazines.com/compute/issue43/158_1_64_Mosaic_Puzzle.php
) the screen shot is nothing like it - so no that aint the right game.

Hi

Once a fellow lent me an Atari magazine. This magazine had a section,
sort of interactive section. This column featured a BASIC listing, that
you should type in your computer at home. The listing had a bug, and
your mission was to discover where in the listing the bug was.
The magazine I read had a BASIC listing of a program that prompted to
the user both values for a A and B variables, and the program answered
with the sum of both variables. The case is that the result the program
gave was deliberately wrong...The article featured a pretty drawing of
some bugs doing a 'wrong' sum on a chalkboard... something like 2+2=5
....

Anybody rememer this magazine?...I've been looking for this magazine
for *years*.

Regards

Well I don't know anything about Commodore 64. Did it have the ability
to use redefined character sets? Maybe it's just a simplified display.

Was the game in question on a 4 x 4 grid at least?

I can't find that October issue of Compute!. I think I found April,
August, September, and December of '83 but not October. That was the
year I let my subscription lapse so I may never have had the issue.

Oh well. I tried. I'm sure someone will find the puzzle you are
seeking.
```

6865. Editor manual doc's

Newsgroup: comp.sys.atari.8bit

Hi,
I recently started using a small text editor I found on an atr, but can't remember which one. The Editor loads and on the top line. Title is shown screen edges are bordered.
Edit 2.5
I have been able to get the program to load and save files with Cntl+L for Load and Cntl+S for Save. I have been trying different keys to cause the program to delete characters and lines, but today I did something that caused the screen to collapse to less than 10 lines. And the Esc key quits the program. But I am sure there is more to this program, I just need a hint or text file for keys to format the text.. Text does not wrap at 40 columns.

TIA

RoyE

This is JBW Edit: http://trub.atari8.info/files/ED.ARC

The keys are:

* Ctrl/L - load
* Ctrl/S - save
* Ctrl/U - make "window" smaller (move the lower border up)
* Ctrl/D - make "window" bigger (move the lower border down)
* Ctrl/V - make EOL characters visible
* Ctrl/B - cursor to begin of text
* Ctrl/E - cursor to end of text
* Ctrl/A - cursor to begin of line
* Ctrl/Z - cursot to end of line
* Ctrl/T - tag line
* Ctrl/G - go to tagged line
* Ctrl/Q - escape character (allow to type in all of the above)

The program is ideal for small edits, but if the text file is 6-8k long, it
becomes slow.

KMK

Thanks,
Now I am able to see the full screen again. I have also been able to use a
few shifted control keys:

SHIFT+CTRL+UP ARROW for page up
SHIFT+CTRL+DOWN ARROW for page down

Thanks again
RoyE

Does XF551 normally speed at 300rpm or 288rpm?

Some IBM style 360K drives work with XF551 board due to power limit. I am curious, how many MAX watt of the drive does XF551 require?

Thanks!
Jack

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

6872. atari++ 1.46 released

Newsgroup: comp.sys.atari.8bit
Date: 2006-06-07 15:54:50 UTC
From: Thomas Richter <thor@math.TU-Berlin.DE>
Message-ID: <4eob6bF1ff395U1@news.dfncis.de>
Source record: 6629

Hi folks,

update time! A new stable release of the Atari++ emulator for Linux and
Win32 has been released. As usual, you'll find it here:

http://www.math.tu-berlin.de/~thor/atari++/

What's new this time:

Many thanks goes to Mark Keates for providing a really detailed
emulation of the AMD flash ROM chips, and thus for making Steve
Trucker's Flash Carts now really flash-able. The emulator is able
to save these carts back to disk as required.

Furthermore, creation of disk images has been simplified a bit. To
create an empty disk, just type in a non-existing file name, then format
this virtual floppy from the DOS of your choice (or the built-in one).

A couple of improvements have been made for the built-in FMS and Os.
For the former, Dos 2.5 directores can now be read fine, and the memory
requirements have been dropped considerably (MORE room for programs).
For the latter, text windows on Gr.9/10/11 have been improved and no
longer flicker during SIO operations.

A couple of other minor problems have been hopefully fixed, more`s in
the README.

So long,
Thomas

Hi Michael,

The media that Synapse used back in the 80's doesn't age well. I have a stack of them that had the same problem you describe, but for the Commodore. I think the Mylar coating just doesn't hold up to time on those and it comes right off with normal use. I also have to scrub my disk drive heads off after this to avoid disk errors.

ISTR most type-in magazines had this "feature" where each issue they
had type-ins that had hidden bugs for you to find. Then they had a
"Debug" column at the end of the magazine where they fixed their
programs based upon feedback...

Hi

IIRC, that listing was part of a mini-contest, if you sent back a
working listing of the program, you won a prize or something....I can't
recall that clear, it was a long time...

Anyway, I've been looking for this article on the Antic archive, with
no results....I'll keep looking for it.

Regards

Hmm, yet I did not have any problems with these disks when used with an Indus GT drive, even just moments before I wrecked them with the XF551.

Also, I never tried to clean the XF551 drive heads after this happened, the drive still worked fine with everything else.

If anyone else has an original Blue Max disk for Atari, does it still boot with a drive other than an XF551? Can you boot it with an XF551? (Try the non-XF551 boot experiment first!)

-Michael

It's from _The Atari Connection_, volume 2, number 3 from fall 1982.
Here's the code:

```
10 GRAPHICS 18:X=2:DIM M$(30),N$(30)
20 ? #6;" MATH - A - MATIC":POKE 712,178
30 OPEN #1,4,0,"K:":M$="":N$=""
40 GET #1,N:POSITION X,5:IF N<48 OR N>57 THEN 70
50 M$(LEN(M$)+1)=CHR$(N):A=VAL(M$):? #6;A
60 GOTO 40
70 IF N=43 THEN POSITION (LEN(M$)+2),5:? #6;"";CHR$(N);""
80 X=(LEN(M$)+5)
90 GET #1,M:POSITION X,5:IF M<48 OR M>57 THEN 120
100 N$(LEN(N$)+1)=CHR$(M):B=VAL(N$):? #6;B
110 GOTO 90
120 IF M=43 THEN ? #6;" ";CHR$(M);" "
130 Q=(LEN(M$)+(LEN(N$)+6)):Z=A+(-2*(OP=45)+1)+B
140 POSITION Q,5:? #6;CHR$(M)
150 POSITION Q+2,5:? #6;Z
160 FOR DE=1 TO 1500:NEXT DE:RUN
```

Correct entries made it into a drawing, and the winner got a
Centipede cartridge.

Hi - after quite some time I've dug out my 800XL and have dived back in with both feet. There's something calming about metal sprung cartridge flaps.

Anyway I found my old joystick and it's somewhat wonky: does anyone have a Powerplay Cruiser they'd be willing to part with? I'm in the UK, although am willing to pay postage from elsewhere. Any colour will do, lovely though the green&pink one was.

Trystan

Thanks John, that was *exactly* the program I was looking for :-D
Thanks for taking the time to type that BASIC program. Anyway, I found very little info on that Atari Connection magazine on the internet, here are some links:

http://digitize.textfiles.com/items/1983-atari-connection/

http://www.strotmann.de/twiki/bin/view/Infothek/AcFallEightTwo

I thought I could find the OCRed magazines on atarimagazines.com or atariarchives.org, but there's nothing on them...

Anybody knows where can I find some more info about this great magazine?
Anybody has this issue for sale/trade?

Regards

I imagine it would be a challenge to get today's Atari, Inc. (Infogrames) to grant permission. Or maybe, no one has tried yet!

Everything at atarimagazines.com is there with permission of the rights holders.

>Anybody knows where can I find some more info about this great
>magazine?

There were 14 issues of Atari Connection, Atari part# CO17668, from Spring 1981 through Summer 1984. Atari Connection was one of the casualties of the 1984 Tramiel takeover, though shortly thereafter Atari Corp. started up a replacement magazine, Atari Explorer. Atari Explorer lasted for 36 issues, from February 1985 through January/February 1993.

Atari Explorer spawned Atari Explorer Online, which started May 1, 1992. AEO became Jaguar Explorer Online with the March 27, 1997 issue. The last issue of JEO was December 31, 2001. AEO and JEO have a (hibernating) home page at http://www.atarihq.com/jeo/ .

>Anybody has this issue for sale/trade?

Using a MyIDE+Flash cartridge, CF adapter and Matthias's PC tool
for MyIDE drives you may be able to do this.

There is also SIO2IDE, which I have not tried but I would assume
a IDE->CF adapter would work nicely with as well.

I rather liked the old Atari Explorer magazine. Though, it was perhaps the flimsiest of the Atari Magazines available at the time, it was a magazine that had a style that set it apart.

I only ever purchased six issues of Atari Explorer; my magazine budget was rather limited back then, so I had to choose between Antic, Analog, Atari Explorer, Compute!, STart, ST World, ST Action, and Current Notes. Antic and Analog got the nod most of the time, and I became partial to STart and ST World for the brief time that I owned a 520ST.

Seems I was holding out for the Atari Transputer Workstation for a time, and much of my magazine decisions revolved around transputer centric news and articles. Eventually, however, my local Atari magazine source ditched the Atari platform altogether and I was forced to rely on online magazines like Z*Mag for my Atari news.

And the rest, as they say, is history...

6902. Atari 2600: S-Video, stereo sound

Newsgroup: comp.sys.atari.8bit
Date: 2006-06-15 13:48:16 UTC
From: cb meeks <cbmeeks@gmail.com>
Message-ID: <1150379296.107694.318010@u72g2000cwu.googlegroups.com>
Source record: 6559

Hope I am in the right group.

Anyway, I have an Atari 2600 Jr. (the small, black one) that I am fixing up. About to add S-Video and stereo sound (well, mono but two channels). I am also going to re-paint and probably install a NICE RCA jack for the video out (seperating the chroma and luma into two RCA plugs)

I thought about doing several of these. Maybe keep 1-2 for myself and try to sell 2-10 of them.

Do you think people would pay for something like this? How much?

Thanks!

cbmeeks

6903. Memo Pad - Release 2

Newsgroup: comp.sys.atari.8bit
Date: 2006-06-16 02:30:42 UTC
From: eparent <eparent@gmail.com>
Message-ID: <1150425042.585892.131460@i40g2000cwc.googlegroups.com>
Source record: 6560

Hello,

Release 2 of Memo Pad, my ATASCII file viewer and converter for
Windows, is ready for downloading.

In this release I fixed a scrolling problem that would appear when
viewing files with more than 32767 rows or columns. I also added a
binary view mode.

You can download Memo Pad at
http://joyfulcoder.com/software/memopad/

Thanks,
Eric

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hello James,

I will add an option to change the numeric base of the offset values.
Expect it in the next release.

Thanks,
Eric

Colonel Klink was the dippy Kommandant (spelling?) of Stalog (spelling?) 13.
He was the guy that fooled himself into believing that he was in control.
He was also a spineless Nazi.

The prisoner, Colonel Hogan, had full control over the Kommandant... though
the kommandant believed Hogan to be isolated and contained within the
prison camp. "Never an escape," was the trademark saying of Colonel Klink.
Although, one wonders why anyone would want to escape from Stalog 13...
The prisoners could fight the war much more effectively from within the
prison walls.

Don't waste your time with these clowns, RoyE. They don't even own Atari computers and APE is very easy to find on the Internet.

As a general rule, when you get somebody asking for something that is very easy to find, you're wasting your time by responding to them with any valuable information. Best bet is to treat them like the imbeciles that they are, or to to just ignore them.

6918. Too many variables error & basic question.

Newsgroup: comp.sys.atari.8bit
Date: 2006-06-19 14:11:50 UTC
From: "Z.Beeblebrox" <the.z.guy@comcast.net>
Message-ID: <1150726310.572701.90900@p79g2000cwp.googlegroups.com>
Source record: 6575

I was toying around with an old basic program I never finished from
eons ago.
Then it ran out of variables. You can only have 128 different
variables on my 800xl in basic.
That's a lot....and I swear it seems like I haven't used more than
126.....but I digress....

Is there any nice way of working around that problem? I guess I could
manually rename & re-use variables, making sure I don't step on my own
program. That's a pain.

My second question - somewhat related - there was a program I had in
the old days that would allow you to rename variables, re-number your
program in full or in part, etc....you could manipulate your basic
program. What was that? Does anybody have it in an image file?
um....with instructions?

-Z.B.

Hello Kevin,

Yes, I do plan on making this into an editor. When I started this project I named it Memo Pad because I wanted it to end up being an editor like the memo pad built into the 400 and 800 computers. I then left the project for a few years and just recently was inspired to work on it again. I hope others are finding it useful.

Thanks,
Eric

I was never really a BASIC programmer, but I seem to recall one of the oddities of Atari BASIC was it saved the variables even if it shouldn't. Just some weirdness like if you used a variable in immediate mode then saved your program, it saved the immediate mode variable too. If you did stuff like
10 Z=0
Then changed your mind to use something more discriptive like
10 ZERO=0
Both Z and ZERO are saved and count against your total.

Anyway I do sorta remember the work around: LIST program to disk, type NEW in immediate mode, ENTER the program. You can then go back to SAVE and it should have the variables cleared up.
>
> Is there any nice way of working around that problem? I guess I could

The concept of local and global variables, while it isn't built into BASIC helps. In BASIC everything is global but if you divide your variables you should cut down on the number you use. For instance, if you can keep track of your nested loops, you only need a couple of loop counters tops. That is lets say you have a bunch of loops in your program like:
10 FOR N=0 to 10; do something
125 FOR X=1 to 3; do something else
200 FOR Y=MSC to MSC+SCREENSZ; do something else

Now unless one of these loops calls one of the other loops, you only need one loop counter. If one of the loops calls another loop, you only need 2.

You can also explicitly state numbers and explain it with comments, for instance line 200
200 FOR N=MSC+24*40: REM 24*40 GR.0 size.

APX had some utilities like this by White<or Crawford?> IIRC. I think I got them on a PD disk from B&C Computervisions.

BUT I would just create my spagetti code with all the goofy line number then do something like load TURBO BASIC and use that to renumber it. I think the White utility didn't resolve line numbers as targets for GOTO or GOSUB.

When out of variable names there were two tricks.

- clean up the variable name table.

Atari BASIC adds names to the VNT but never removes names. For example, If you used a variable Z in your progarm and later discarded it it would still be in the VNT.

The easy way to clean up the VNT is to simply LIST your program to a file then use ENTER to bring it back. VNT will be clean of unused variable names.

- If you genuinely are running out of variable names this is the only trick that I can recall: Use arrays as scalars.

It's very clumbsy but if you are desperate it works.

For example:

Instead of

POLY=coef1*term1^3+coef2*term2^2+coef3^term3+offset

you might use

term(100)=coef(1)*term(3)^3 + coef(2)*term(2)^2+coef(1)*term(1)+term(4)

Instead of 8 variable names, poly, coef1, coef2, coef3, term1, term2, term3, and offset, there are now only 2 variable names, term(and coef(. Note that Atari BASIC makes a distinction between array names and scalar names.

You can have both "term(", meaning array name "term", and simply "term" (scalar).

[Yes, I know Atari BASIC uses only capital letters. I'm too lazy to retype].

Unfortunately, you CAN NOT use code such as:

```
FOR LOOP(1)=1 TO 10
```

or

```
INPUT MYSCALARS(1)
```

It would be nice if you could but you can't.

In conclusion, all of the above using array elements as scalars is a pain and doing so can make for some hard to read code, but like I said, "if you are desperate..."

Oops!

Don't forget to type NEW between LISTing and ENTERing your file.
Otherwise the VNT won't be clean.

> That's a lot....and I swear it seems like I haven't used more than
> 126.....but I digress....

You could simply create your own variable space. Use a section of memory such as Page 6 ($0600-$06FF) to store values for variables. You would store them with POKE and retrieve them with PEEK.

If they were integers you would break them up into byte values. If they were decimals with a floating point you could copy their value from the Variable Table Pointer for that variable (Note this mirrors an Array storage solution).

You could also store to disk instead of memory for the same effect.

An Alternate method is to use modular programming where you would load in a separate program segment to hand portions of the program where the most variables are needed (or something similar). This would cut the total number of variables in a program segment to at perhaps 50%-75% of your current max out number of variables.

Each of these offer more values to be stored at the cost of processing time.

You could simply create your own variable space. Use a section of memory such as the lower part of Page 6 ($0600-$067F) to store values for variables.
You would store them with POKE and retrieve them with PEEK.

If they were integers you would break them up into byte values. If they were decimals with a floating point you could copy their value from the Variable Table Pointer for that variable (Note this mirrors an Array storage solution).

You could also store to disk instead of memory for the same effect.

Thanks.

Now that you mention it, I do recall the variable name table not being
cleared properly.

But I would never have remebered it, unless I traveled back to 1985.

I will do it.

Now that is slick.
That the sort of thing I would have done 20 years ago when all this stuff
was fresh in my mind.
I forgot about the free/open space I could just POKE.

If it comes down to it, I will poke away.

That range is 1536-1791......

On Mon, 19 Jun 2006 at 19:03 -0400, Z. Beeblebrox's posting contained this nested "quote" from somebody's earlier posting:
->> APX had some utilities like this by White <or Crawford?> IIRC.

Monkey Wrench may also have done this, but it's been a long time since I used it (or had an 800 set up!). Disk Doctor was another program that changed variable names.

One of my unfinished projects back in the '80s was modifying my copy of the game called Softporn, later known as Leisure Suit Larry, so I wouldn't have to reboot it whenever I made one of the choices the game considered fatal. Since the the entire variable table was hidden, I used Disk Doctor (in a tedious process) to make the variables visible so I could see the Basic code. As I recall, the program used about 99% of available memory, so I had to figure out what I could delete or edit so as to make space for the "improvements" and jokes and stuff I wanted to add. Tricks like invisible variables (which showed up as blank space in printouts), filling up the variable list, and using all the memory, seemed to be intended to prevent hacking & copying. (In my case it worked, because eventually I ran out of patience. <grin>)

> [aka Rob]

Oh, I didn't notice your second question.

I used to use a utility (type-in I think) called Extended BASIC. Has a renumber utility, Cross Reference (list variables and line numbers), quick reference (just variables), and has variable name replacing.

The renumber utility does not handle the format GOTO X.

I was looking for this program about a year and a half ago. Someone helped me but now I once again forgot in what publication the article appeared.

At least I can still find links!

ftp.spudster.org/CTH/Programming/Doc/ file:EXTBAS.DOC
ftp.spudster.org/CTH/Programming/BASIC/ file:EBASIC.ATR

Works with Atari BASIC only.

- Steve Sheppard

6934. KOOK.....TERRY ORTMAN GOES TO JAIL FOR 31/2 YEARS!

There was probably one from each of the major mags;
I used the one from Compute! which loaded at boot as
an Autorun.Sys and added XREFerence and RENumber
and, I think, REPlace into Basic thru their Wedge method.
The RENumber command was quick and effective except
for some constructs such as ON.. GOSUB/GOTO.

The LIST and ENTER process is good as mentioned to
clean the Variable Name Table of unused entries and you
could also bring the listed file into TextPro and use a
replace to rename every occurance of a variable name.

Your utility sounds just like Extended BASIC!

I think Zaphod can really make use of the XREF and QREF features. It's
far easier to count the number of variables from a straight list than
to scan through the entire source code.

Extended BASIC is pretty seemless. Works fine with the DOSes I use, basically only Atari 2.0D and MyDOS.

Speaking of DOS, Extended Basic provides some basic DOS commands to the BASIC enviorment. You can call up directory listings, format disks, and rename, lock, unlock, or erase files.

Extended BASIC does use about 4K of memory, which means 4K less for BASIC programs.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hello All,

I have new batches of Atari 800/XL/XE to SCART or RCA cables. These are currently being sold on eBay at a fixed price. Link is:

http://search.ebay.co.uk/_W0QQsassZdeangarraghty

Before anybody has a moan, yes I know people could make these cables themselves. But, there are many who can't for whatever reason.

Dean Garraghty

6945. 21 more issues of Compute! at AtariMagazines.com

It was never 'mine'; it was a type-in from the May 1986
COMPUTE! by a Gary W. Swanberg called DEBUT for
debugging utility. In addition to the features we have mentioned the FIND
var command would list all lines
which contain variable 'var' and VIEW would list the
contents of all variables; both inquiries accept an optional
line number range parameter.

Thanks, works fine even on Linux (using wine) ;)

Ciao

[Correction below]

Yes, thank you. I understood that you were not the author of DEBUT
when you earlier typed, ".. I used the one from Compute!..". However,
since you did not name the utility at that time I simply refered to it
as, "your utility", meaning the one that you were describing.

I now know that "your utility" and "my utility" (but I am not the
author) are not one and the same.

Sorry for the confusion and the re-buff.

Actually, though I never did much BASIC programming, I've always been fascinated by utilities that enhance Atari BASIC, not so much the advanced BASICs like BASIC XL and Turbo BASIC XL, just the enhancements for plain Atari BASIC.

Back in the early 80's I remember wanting, very much, to purchase Monkey Wrench II. I don't recall why I never did but I never forget the fact that I did.

Incidentally I recently discovered that one can simply merge the MW2 image + Atari BASIC image into one 16K cartridge (or cartridge image) . Works great in a real 800XL combined with the BOSSXL 2 OS. Emulators configured similarly also work. So no is there a need for a real 800 and a right-slot MW2 cartridge.

[EDIT - I meant XLBOSS 2.0 OS, not BOSSXL.]

Now I'm going to look for "your" DEBUT because I hadn't recalled hearing that name mentioned until now.

Thanks!

- Steve Sheppard

Looks like the problem is on line 130.
Remove the nonsense garbage (-2*(OP=45)+1)
It should work fine now.

I await my centipede cartridge with great anticipation.

You played the highest level and usually win?

I've won the highest level, but had to resort to trickery, which often caused the colony to suffer. Basically, I would concentrate 100% on energy and food, and supply the whole colony with all they want (at the bestest price I can get, but always made sure everyone got what they needed). Then the other players would go only to mining stuff, allowing me to supply them wholey with the other essentials.

Then on the last two or three rounds, I would cut off all food and energy (which is always the round they somehow suddenly get the very high gain on me), refusing to give them a single unit.

By that method, I have often won the highest level.

Nah! I think the expression (-2*(OP=45)+1) is a decoy.

In Atari BASIC (OP=45) is a valid boolean expression. If expression is true the value is 1 if false the value is 0.

So, if OP were equal to 45 then (-2*(OP=45)+1) would evaluate as (-2*(1)+1) or simply -1.

However, in the sample program OP is never defined and in Atari BASIC an undefined var defaults to 0.

The expression, (OP=45) is then false and the whole expression, (-2*(OP=45)+1), evaluates as (-2*(0)+1) which equals 1.

I have to admit I can't solve this puzzle. My BASIC skills might be good enough (barely) but my powers of deduction aren't. I just don't see it.

There are several minor problems in this short program;
beginning with allowing two 30 digit numbers which A8
Basic will only display in "E+" scientific notation and will
not fit on one 20 character GR. 2 line. The OP is for the
math operation probably limited to plus (43) or minus (45);
it should be assigned in line 70 with OP=N and is not needed
in line 120. Then Z would equal A +(-2*(OP=45)+1)*B in
line 130. Multiplying the expression and B would effect an
addition or subtraction of A and B. It still needs some error
checking of user input...

Well since it's already spoiled, what I thought was a decoy,
(-2*(OP=45)+1)+B, turned out to be the heart of the solution, providing
all the clues.

I did see the expression error, change "+B" to "*B". BTW, the boolean
expression tests for ASCII code "-" symbol which is 45. "+" is assumed
otherwise.

I would have substituted N for OP right there.

Change two if statements, for example IF N=43... to IF N=43 or N=45..
One test allows the display of the "-" symbol.

I saw a slight formatting problem but I bumbled the fix.

RetroJess, please don't tell me you solved this by simple inspection.

I had to do actual testing and debugging.

I guess the extra credit for the problem would be how to modify code to
perform multiplication and divsion in addition to addition and
subtraction.

I had an 800, still do, so MW2 would have been OK.

I'm guessing that giving up the extra 8K of user memory was too big a
penalty or my enthusiasm simply wore off.

Problem is, there is no variable OP anywhere else in the program, so why should one be looking for OP=45 if it will always equal 0?

That would be like saying, -2 * 0 = 0, or 0 + 1

Thus, the +1 would always give the correct answer, then add another +1 to it.

I tried a number of additions on this program, and it always seemed to give the answer, plus one.

Can anyone find a scenario in the program where if you take out the (-2*(OP=45)+1 where it would give an incorrect answer?

```
One thing I missed was line 120 where M=61 would
produce an equal sign in formatting the output.

If you remove the that expression from the statement to read Z=A+B the
calculator can only perform addition.

If you correct the two errors so that Z=A+(-2*(N=45)+1)*B (don't forget
it's *B not +B) now the calculator performs addition OR subtraction.

Fix the IF statement by adding "OR N=45" and you display the minus
symbol during a subtraction calculation.

It seems in Curse of Ra, level 4, rooms 36 and 37 are missing, along with treasures #10 and #12. Descriptions for these are in the manual, so I'm wondering if they're just well-hidden, or they're actually missing.

I wonder if they're missing from other versions as well...?

A text version of the manual can be found at:
http://project64.c64.org/games/m-z/Temple%20of%20Apshai%20Trilogy.txt

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

6968. Advan BASIC

Newsgroup: comp.sys.atari.8bit
Date: 2006-06-30 14:15:24 UTC
From: FujiMan <Rory.A.McMahon@gmail.com>
Message-ID: <1151676924.288280.307170@b68g2000cwa.googlegroups.com>
Source record: 6475

Hi All!

William Graziano and I wish to announce the release of Advan BASIC compiler suite to public domain as of July 1st, 2006. He has removed the copy protection from the disks which are now available in ATR format (for diskettes and emulation). The documentation is available in text, ms word, and pdf.

Files are available from me via email, or off the webpage http://fujiman.no-ip.com/Advan.htm AFTER July 1st. I'd prefer to email it, as the web page is on my home computer.

There will be Advan BASIC competition for the best software written with Advan BASIC. If anyone would like to donate prizes please contact me. We need 1st-3rd prizes and 2 runners up.

Rules are simple:

Contest from July 1st to Sep 1st (1wk extension if necessary)
Written in Advan Basic using any utilities included. Source must be included and in the PD.
Must run on any stock machine. Atari 400->130xe. Advan allows 4 drives max.
It can be any kind of software (Game, Utility, Productivity, Educational, etc)
Any number of people can work on it.
?? -- To be added if needed.

Submisisions will be judged by 5 judges (William (the author), Rory(me), and 3 others to be determined) on a rating of 1 to 10 for the following:

Originality: How original (this means no font editors - We have waaaay to many of those)
Design: How modular is code? Can it be easily modified?
Graphics: How well is it laid out?
Working: Does it function properly?
?? -- To be added if needed.

Please email me with submission ideas for your submission ASAP. I will post them so we dont have duplicate submissions and we have a wide range of choices.

If I have left out the obvious, let me know.

Thanks,
Rory

LOL,

manuals, we dont need no stinkin' manuals...

At that age, the only manual perusing was to figure out which keyboard
key did what. I paid no attention to what treasures were there, I just
wanted to play. Now you've done it...

I'll have to go play it...

Rory

Hi all (again),

Slor has graciously donated webspace for the Advan Suite. I will have
it all up tonight (Fri) at:

http://advan.oldos.net

This will be mirrored from fuji.no-ip.com site. After all is added,
link will replace the fuji site.

This will also be the site for any donated source code, apps and utils.

If this happens to get poplar, webforum for support.

>it because the POKEY handels disk access as well as sound output?

Other posts probably address this more accurately. I wonder if there's
any connection between this and the way cassettes work. Cassettes also
have a loading sound that can be muted, though the saving sound can't be
muted.

>Secondly - I can only speak of PAL systems, though - even when those sounds
>are muted by setting $41 (dec. 65) to 0 they are still audible, at least
>with all the TV sets and monitors I've used my Ataris with.

It seems to me it just turns the volume way down. When I had an
XM301 modem, you could hear the phone dialing through the TV, and
when it connected, it silenced it much the same way. But over time,
as my 130XE started to die, the sound would leech through a little
more. At one point the modem caused a hum whenever it was plugged
in, and you could hear the data in the 300-baud signal. Near the
end, the disk drive would only work if the modem was unplugged, so
it's a good thing I had that 64K ramdisk.

I rather liked the loading sound. It was a happy sound, like the
Atari was excited about what it was loading.

lp,

Yeshhh, I schtarted drinking before finishinging codeining. Naht a good
ideea. Hic!

I was also having transfer issues to the server.

If there are any other things I broke or that is missing let me know.
I'll try to fix'em soon as possible. I will be updating it often as
stuff appears.

Yes the pdf are big and zipped to keep from loading into browser pdf
viewers. The BASIC manual itself it over 5mb.

Greetings everyone!

Here are the lucky, the few, the proud winners of this months prizes at
The DarkForce! BBS:

June 2006
1. Final Frontier 2 - none (game rolled over to next month)!
2. ST Magazine - Doctor Clu wins the free 3 mag. subscription!

Congratulations to our winners!

Also, here are next months prizes:

July 2006
1. Final Frontier II - one lucky winner, or *team* will win the $75.00
prize. Team members will divide up winnings. If the game goes into more
than one month, that months prize money will be included. As sysop, I will
be playing, but am exempt from winning, or joining any team. 2. ST
Magazine - some lucky Atari caller will win a free 3 mag. subscription.

Good luck to all! :-)

6979. 1050 Mod identification

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-04 03:28:18 UTC
From: FujiMan <Rory.A.McMahon@gmail.com>
Message-ID: <1151983698.825930.59120@j8g2000cwa.googlegroups.com>
Source record: 6486

Hi all,

I have a non-functioning1050 drive with PCB mod (Happy type) that needs to be identified. I want to guess a Duplicator, but it does not match the pictures on Patchells site.

It has 2 DPDT switches, one has a transistor (2n3906) and another component not identified, mounted on it. This switch is hooked to the JP jumpers and U6 on the 1050 board. The other switch, is hooked to the PCB to solder pads, and this could've probably used a SPDT instead.

It has a slow down mod of some sort (2719 to variable resistor to the 6532.. no diode though)

The board has the following chips:

65C02,HM6264LP-15, 27128 EEprom, 74LS00, LS133, LS138, LS257, LS74, LS27 all socketed.

All this plugs into U9. U10 and U13 nothing in socket. U8 has been scratched

Any help identifying this thing or installation/instruction manual is greatly appreciated.

FujiMan

6980. BASIC programming, random# and arrays.

Newsgroup: comp.sys.atari.8bit

From: "Z.Beeblebrox" <the.z.guy@comcast.net>
Message-ID: <MdadnZp5s5AB6DfZnZ2dnUVZ_qCdnZ2d@comcast.com>
Source record: 6487

hi kids -

I'm trying to figure out a really slick way of handing out a set of random numbers without duplicating.
I'lll explain:

I want to generate random numbers from, say, 8 to 16, handing EACH number out until the range is exhausted....
So the output could be 8,9,10,11,12,13,14,15,16.....or any combination thereof. As long as each number was used once and only once...

I've tried a few methods, and am trying to balance speed & memory used.

I can use (rnd(0)*9)+8 then store the result in an array, like num(1) then num(2), num(3), etc.....then have a "for next" loop to make sure no duplicates are given out. But that is kind of slow, especially when its down to the last few digits. It keeps picking then checking, then re-picking....as I said, slow.

I also tried a "less random" method where I have a handful of DATA statements with the number set defined.
Like "10 DATA 8,9,10,11,12,13,14,15,16" or "20 DATA 16,8,15,9,14,10,13,11,12" etc... but it takes up a lot of space, and isn't quite as random as I'd like. What I do here is randomly restore to a line number, then begin to read the line of numbers.

Any suggestions for a quick method of doing this? Thanks!

-z-

6981. Re: BASIC programming, random# and arrays.

Message-ID: <clSdnRb-BZLqEDfZnZ2dnUVZ_sGdnZ2d@comcast.com>
Source record: 6488

Here's an example of one method I've tried. This *seems* to work OK.

This stores the random number[s] in an array, then goes back and checks the array to make sure the number wasn't used already. It also uses a "hi" and "lo" variable, which helps quicken the process (I think) because after it picks the top number or bottom number, it removes it from the random number generating line.

This picks numbers from 1-10, randomly, and stores into N( )

```
10 DIM N(10):HI=10:LO=1
15 FOR Q=1 TO 10
20 Z=INT(RND(0)*HI)+LO
30 IF NOT C THEN 70
40 FOR X=1 TO C
50 IF N(X)=Z THEN 20
60 NEXT X
70 C=C+1
80 N(C)=Z
85 IF Z=HI+LO-1 THEN HI=HI-1:GOTO 95
90 IF Z=LO THEN HI=HI-1:LO=LO+1
95 NEXT Q
100 REM DONE - PRINT RESULTS BELOW
110 FOR Y=1 TO 10:?N(Y):NEXT Y
120 ?:?:RUN
```

So, you think that's pretty efficient?

-z-

Z.Beeblebrox wrote:
> Here's an example of one method I've tried. This *seems* to work OK.

There's an old Wilkinson artical in Compute where I think he did
something like a random card shuffle. You should try and find that one
for a clear explaination of a fast shuffle.

BUT I wouldn't go about it the way you are. You should use BASIC
strings because they are thing BASIC handles fast.

Procedure should be ~

Have a fixed string like "12345678". Use this to assign your working
string since the copy is faster then assignment.

Have your random number be an index into your string. For instance if
your first random number is 3 then RESULT$=WORK$(3,3)

Now use the fast string copy to reduce slide the string so your original
work string is now "1245678"

Reduce the seed for your random number by 1 so it stays in the range of
numbers not chosen. You could use it as the loop counter.

When your loop gets to one, just pull the last number to avoid the
random number generator which is kind of slow.

I'm not sure exactly what you want for the result. For instance if you
wanted random numbers in the range of 16-24 you could just add 16 to the
result or use WORK$(1,1)=CHR$(16) type assignments.

6983. TECH: fix Atari 800 start button

Hi Everyone,

I am new to this newsgroup.

The start button on my childhood Atari 800 stopped working. Is this a simple fix, or should I just look for another working machine?

If it is a simple fix, where do I look for intructions on the fix? Or where do I find the part?

Thanks!
Joe G.

I wonder do the SELECT and OPTION keys work?
A simple BASIC program could be used to test the CONSOL keys.
```
10 X=PEEK(53279)
20 ? X;",";
30 GOTO 10
```
If SELECT and OPTION work, then it is probably the button
for START. Maybe you could figure how to clean the contact.
If SELECT and OPTION don't work, then maybe the POKEY
chip could be replaced.
Oh, the values for CONSOL.
0 All three CONSOL buttons

> > -z-
> >
> >

I came up a little program before I saw Rick Cortese's post which gives
me something to think about.

Anyway this is fast.

Example 1

```
10 DIM USED$(9),CHECK$(9),SUCCESS$(9),SHUFFLE(9)
20 CHECK$=" ": rem pad with 9 spaces
30 SUCCESS$="123456789"
40 FOR COUNT=1 TO 9
50 USED$=CHECK$
60 I=INT(RND(0)*9+1)
70 CHECK$(I,I)=STR$(I)
80 IF USED$=CHECK$ THEN 50
90 SHUFFLE(COUNT)=I+7: rem +7 for the example range 8-16.
100 IF CHECK$=SUCCESS$ THEN 200
110 NEXT COUNT
200 FOR I=1 TO 9
210 ? I,SHUFFLE(I)
220 NEXT I
```

Here I used digits and STR$ function to illustrate what the program. In
example 2 I used ATASCII codes and the CHR$ function to expand to 255
items. A string of CHR$(0)'s is used to pad CHECK$ instead of spaces,
giving the range of 1 to 255.

As each item is used it's position is filled in CHECK$.

IF USED$=$CHECK this indicates an item has already been used. No need to check array elements one by one.

This method gets pretty slow after about 220 items. Especially the very last item (which Rick already pointed out regarding shuffle methods).

Example 2

```
5 REM GENERAL PURPOSE SHUFFLE
10 DIM USED$(255),CHECK$(255),SUCCESS$(255),SHUFFLE(255)
20 FOR I=1 TO 255
30 CHECK$=CHR$(0)
40 SHUFFLE(I)=0
50 SUCCESS$(I,I)=CHR$(I)
60 NEXT I
70 FOR COUNT=1 TO 255
80 USED$=CHECK$
90 I=INT(RND(0)*255+1)
100 CHECK$(I,I)=STR$(I)
110 IF USED$=CHECK$ THEN 90
120 SHUFFLE(COUNT)=I
130 IF CHECK$=SUCCESS$ THEN 150
140 NEXT COUNT
200 FOR I=1 TO 255
210 ? I,SHUFFLE(I)
220 NEXT I
```

I don't have a suggestion of how to do it, but I do suggest you don't
try all possible DATA statements. That would be 9*8*7*6*5*4*3*2
or 362880 permutations.

Now that is slick!

Only n-1 calls of the random number generator and the same number of
assignments!

Makes my method looks silly :(

Kudos!

...And more importantly, no validity tests!!!!!

oops, I guess it's n-1 RND calls and n assignments.

Hi Russ -

I don't truly need all permutations, so having a small handful of data
statements was actually OK.
Not fantastic, but OK.

-thanks
z

thanks!
I'm not sure if or how that differs from steven sheppard's suggestion.
I'll try it.

thanks, I'll try that.
I guess this is just like Rick Cortese's solution? Rick didn't print any
code so I'm not too sure.
If you hadn't included the basic code, I would not have been able to figure
it out. So thanks again.
I wish I didn't have to dim 3 more strings to do the random #s though.

Speed-wise it runs more or less as fast as the code I printed. But mine
doesn't have to dim those strings.
I'm tight on resources.....

Well I'll see if it works better anyway. I'll give it a shot.

-regards,
z

> -z-

Rick's suggestion is huge. The shuffle only needs one pass.

for example

A source string is used to create a set of the items to be shuffled

"123456789"

as you take each random item from the set you leave a shorter set.
Continuing Rick's example, he started with "3".

The Shuffled string now becomes "3" and the sources is reduced to
"12456789"

if the next random item were "7" you get

Shuffle="37" and the source="1245689"

If "1" is next then you have

Shuffle="371" and source="245689"

Notice as the shuffle set gets larger the source set to draw from gets
smaller.

When the source is down to 1 you add the last item to the the Shuffle
set and you are done.

AND, at no time was any testing done. You should move each member of
one set to the other in random order. Just 8 RND calls and 9
assigments (plus string initialization) to shuffle the entire list.

Yes, I see what you mean.

I'll try to figure it out - writing the code I mean.
I guess I can take what you supplied & modify it.

-thanks!

[typos corrected]

Rick's idea is elegant but being rusty at BASIC programming,
implementing Rick's idea was quite a challenge for me.

I'm sure Rick can do it better.

```
10 MAX=100:REM BOUNDS OF SHUFFLE
20 DIM ITEM$(MAX),SOURCE$(MAX),SHUFFLE$(MAX)
30 FOR I=1 TO MAX:SOURCE$(I)=CHR$(I):SHUFFLE$(I)=CHR$(0):NEXT I
40 MPLY=MAX:COUNT=1
50 RAND=INT(RND(0)*MPLY+1)
60 MPLY=MPLY-1
70 SHUFFLE$(COUNT)=SOURCE$(RAND,RAND)
80 COUNT=COUNT+1
90 TRAP 110
100 ITEM$="":ITEM$=SOURCE$(RAND+1)
110 TRAP 32768:REM DISABLE TRAP
120 SOURCE$(RAND)=ITEM$
130 IF COUNT>MAX THEN 150
140 GOTO 50
150 FOR I=1 TO MAX
160 ? I,ASC(SHUFFLE$(I,I))
170 NEXT I
```

I've got the shuffle set at 100 items but you can change it to anything
you want (up to 255 elements).

255 items takes about 20 seconds to complete.

Lines 90 through 110 are bit awkward. I was too lazy to do the upper
bounds checking.

If you are concerned with resources, as in using up variable names, you
could try to implement this all with substrings within one string but
that would be tricky, IMO

If you are concerned with space, three strings, size 10 (30 bytes
total), uses only half the space of one array with 10 elements (60
bytes).

I learned three new things today, or rather two new things and was
reminded of one thing which I had forgotten.

- Rick's slick shuffle
- Atari BASIC allows variables as the size for DIM elements,
array/strings.
- Strings can be any length. (This is the one I had forgotten)

- Steve Sheppard

Actually, I didn't have a problem with his handle. I just thought he was a troll because when I searched for APE on Google, I found it right away. I figured, if something is that easy to find on Google, and somebody goes to the trouble of typing a usenet post, it must be a troll.

If you're not a troll, I apologize. If you are a troll, my comments stand.

Odds are he probably could have found it by googling, but there are
always others who read theses posts and may not even think of looking
for such a think as "ape" and by reading an informative post would then
be pointed into a new direction they didn't know about before.

LOL! I guess we've been trying to re-invent the wheel!

No point and messing with perfection.

Here's the same shuffle adapted to strings. (I kept my variables and
strings, lazy again)

10 MAX=52:REM BOUNDS OF SHUFFLE
20 DIM ITEM$(1),SOURCE$(MAX)
30 FOR I=1 TO MAX:SOURCE$(I)=CHR$(I):NEXT I
40 FOR I=MAX TO 1 STEP -1
50 RAND=INT(RND(0)*I+1)
60 ITEM$=SOURCE$(I,I)
70 SOURCE$(I,I)=SOURCE$(RAND,RAND)
80 SOURCE$(RAND,RAND)=ITEM$
90 NEXT I
100 FOR I=1 TO MAX
110 ? I,ASC(SOURCE$(I,I))
120 NEXT I

6999. PORTABLE ATARI 2600 KIT

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-05 08:05:46 UTC
From: "D.mobster" <d.mobster@gmail.com>

Source record: 6506

Has anyone tried to build a portable Atari from one of these kit's?

> numbers without duplicating.

IOW, you'll try to get a random permutation of given data. One way of doing that is to have an array containing a flag whether a specific digit/item has been picked already. If you have n elements, pick a random number 1..n and check whether the item has been picked. If so, roll the dice again. Alternatively, roll a random number x in 1..n-m, where m is the number of items drawed already, and then advance in the array to the x-th not yet drawn element. Both methods are equivalent, but you definitely need additional storage.

Best reference for this kind of thing: Donald Knuth, The Art of Programming, Volume II: Numerical and Seminumerical Algorithms.

So long,
Thomas

The fast shuffle on compute is pretty slick! Neat string version you
have too.
When I saw the compute article, I thought to myself, "i should have
come up with that!"....just swapping while using a temp storage
area....I've done that before for sorting routines. of course!

I'm amused that a 1983 compute just helped me out. I definitely could
have used that during the 1980s! I could also have really used the
internet in the 1980s! ha ha! Back then, I had nobody to bounce
questions off of or articles to "google"....I'd read my antic magazine
and buy a few books and hope I understood them.

well, I digress....

If it weren't for Rick, I would not have know the phrase "fast shuffle"
which was *key* in searching google for the compute article.

Thanks stephen & everyone else too!

It looks like I will *finaly* be getting an Atari 800 next week! I've only wanted one for about 15 years.

Is the 800 compatible with Sparta DOS X, Snapshot, and G.O.E.?

On my other computer, a Tandy CoCo 3, (which I haven't even had as long as I've wanted an atari 800!) it seems like only ameture programmers (some of them were pretty good!) used Tandy's own G.U.I., Multi-Vue. Even Tandy's own app's had their own user interface, and each mouse-operated program has it's own menus, all similar (but then all g.u.i. stuff seems pretty standard) but not all the same.

I was wondering if it's the same situation with Atari. I'm shure there must be mouse-based applications like word processors, data bases, and spreadsheets for the 800 - aren't there?

If so, are any of these programs compatable?

I really don't care if they use a "consistent" user interface; I'm used to each one being a little different. Diamond, G.E.O.S., Multi-Vue, and MouseDesk are all different, but no more different than any two CoCo/OS-9 programs. The main thing is that I get a complete set of integrated or integratable applications, including or compatible with VisiCalc/Multiplan and an ASCII word processor, and it would be nice if they all used a (relatively) "standard" mouse-based environment.

Thanks!

SpartaX cart will work, SpartaDOS disk based will not work.
'Snapshot' is a program to capture memory by Tom Hunt I think,
don't know if that will work. GOE? If you're talking Diamond
GOS graphical interface, I don't know that either.
Atari 8-bits aren't/weren't much graphical interface, and
you can't use a mouse with Visicalc. Some people have
played with a ST mouse with the 8-bit, but I don't think you're
going to get a text editor/spreadsheet/data base that work 'together'
or with a mouse. Visicalc was very good, but strictly keyboard
interface, not even the joystick.
Summary, don't think about a GUI, it is a novelty and not
very likely to do much, like Diamond GOS I think was basically
just put icons on the screen and use a joystick to run whatever
icon you push the firebutton on.

There was something called the "Rat", which put a mouse on the 8-bits, and I
think Antic was selling some kind of GUI program at one point...

No, but it looks interesting. Too bad I am not technically inclined to do something like that. I would not mind having one. I saw a portable 2600 at one of the CGE's when they held it in Vegas and it was so cool.

Try Best Electronics. They have just about anything for the Atari line of computers. B&C Computers and APX Computers are other places to looks. It could be that the connections for that particular key just need a little cleaning.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

hi everyone,

just wanted to let you all know i recently started an online blog with my daily classic gaming development efforts. I develop for various systems (basically anything from 2600 to nextgen consoles), but i'm mostly working on vectrex, coleco and 2600 stuff.

the blog is updated almost daily with new findings and previews, so if you're interested, take a look at:

http://www.d3signer.com

kind regards,

Martijn

7013. NTSC 130XE in UK!

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-07 22:24:17 UTC
From: Paul Cawley <paul.cawley@clara.co.uk>
Message-ID: <1152311053.14714.0@proxy00.news.clara.net>
Source record: 6520

Guys,
First post on here, hope someone can help.
I live in the UK and have just bought a US 130XE - I have been after an NTSC Atari for a few years and have an 800XL from when I was a kid, plus a PAL 130XE I picked up a few years later, I have plenty of software on both tape and disk.
I have a few questions...

1) There is no power supply with the machine I have bought. I am assuming the pinout on both PAL and NTSC 130XE is the same, and as it is an external supply, I can just plug my UK one into the US machine without step-down - Is this right?!
2) Will my UK 810 Drive work on the US system?
3) How many problems am I likely to encounter with PAL software on this machine? I have plenty of US coded games (Boulderdash, Goonies, Ghostbusters etc.) but wonder if these were re-coded for the UK PAL market? Is it just a case of see what works?
I had a few backups (from disk to tape) back in the day and transdisked these back to disk in the early 90's, if they still work I assume these will be OK on the NTSC machine.
4) Will the SCART cables bought off eBay these days work OK from the monitor out port?

Any help appreciated!
Cheers,
Paul

7014. Yellowing 8-Bit Cases

Message-ID: <1152311497.15341.0@proxy00.news.clara.net>
Source record: 6521

Guys,
All my 8 and 16-Bits were packed in foam to move and left in the loft, now the lot have gone yellow!!!
Anyone know how to clean yellowing cases and keys?
I have heard you need to use a product like CIF, but guess this may not be ideal as it is abrasive and this could scrub off letter on keys and logos etc.
Any ideas?
Cheers,
Paul

Paul,

Get out your masking tape, spray mask and visit the hardware store. Get
crazy with a brush and stencils and pin-striping from the auto store.

http://www.krylon.com/main/product_template.cfm?levelid=5&sub_levelid=10&content=product_list

Spray paint for plastic. No prep work!

The 130XE's from the US needs 5 volts DC, about 1.5 Amps and 60 Hz. You
may or may not need to mod the machine for PAL TV/Monitors. I dont know
what that would entail. Might be easier to buy a international power
adapter if you can.

Unless they have been in a smoking environment, it is more than likely
chemical deterioration, usually hastened by temperature and/or UV
exposure. I've never had any luck with other than spray paint. I use
an "especially for plastics" base coat followed by an almost perfectly
matching top coat for my XF-551 drives. I've never had to do a
computer case, though. -Larry

Actually, upon reading the APE site I'm confused. It seems expensive. Does it come with old software, too? I bought some sort of cable on eBay that's supposed to hook between the 800 and a PC. So I guess I just need some sort of program that works on the PC that tricks the 800 into thinking there's a big hard drive attached. Of course, then I need to find a way to transfer my few remaining working floppies over to the PC to store forever. I'd love to find some old software online, too. I fondly recall Jumpman and Jumpman Jr, but those disks don't work any more.

Yes. The power supply delivers +5V DC for NTSC and PAL machines. No
difference.

> 2) Will my UK 810 Drive work on the US system?

AFAIK, yes. I see no reason why it shouldn't.

> 3) How many problems am I likely to encounter with PAL software on this

> case of see what works?

Phew, depends. Software had a chance to detect on which system they were
running, but it's questionable how well this feature has been used. I
would bet that some less-solid software will break on NTSC. This is
because the VBI is shorter on NTSC. Some polish demos are likely to break.

> I had a few backups (from disk to tape) back in the day and transdisked
> these back to disk in the early 90's, if they still work I assume these will
> be OK on the NTSC machine.

Possibly. Depends. The timing is different, and not all software will be
able to deal with that.

> 4) Will the SCART cables bought off eBay these days work OK from the monitor
> out port?

The cables itself yes, but the rest depends on the monitor. For a TV,
this TV should then support 60Hz input in addition to the PAL standard
50Hz. Ditto for the monitor. Not all do. The pin-out is AFAIK identical.

Greetings,
Thomas

Desperate times call for desperate measures, and a yellowed computer case is hardly a desperate time. VIM is what you want. VIM, a rag, and plenty of water.

Thoroughly dismantle your entire Atari computer, removing all metal and electronics. Once you have reduced your machine to yellowed plastic, grab yourself a bottle of VIM and a rag. Squirt some VIM on to the rag and vigorously rub the yellowed plastic. It will be kind of gross, but don't be in a hurry to rinse the stuff off.

Once you've finished scouring the surface with a VIM soaked cloth, soak the plastic in water and continue to scrub the case with a clean rag. When you're satisfied that you've cleaned the case sufficiently, remove the case from the water, towel dry, and allow the case to thoroughly air dry. Put the case back together, and voila... You are now the proud owner of a clean Atari computer.

VIM works especially well on plastics that have been kept in a confined space with a chain smoker. I had an old Mac that was literally "browned" by cigarette smoke, and VIM worked magic in restoring it to it's original beige color.

To clean the keyboard, follow the same steps, but carefully pry each key from the keyboard and clean them individually. I would suggest that you either remove and clean one key at a time, draw a diagram of each key's location as you remove it, or have a picture of an Atari keyboard handy, or another keyboard for that matter, so you will know where each key goes, as you reassemble the keyboard.

I know this sounds like a lot of work, but once you start seeing the "yellowing" melt away, you'll find that you're actually having some fun. You may even end up searching your residence for other yellowed plastics to clean. :-P

What is VIM?

I dont see anything ever 'cleaning' the surface of a yellowed case,
unless it was caused by smoke, which you can clean off if its not too
bad.

Its a chemical reaction due to heat and ultraviolet light, not 'dirt'
that causes the yellowness (in most situations) and if you DO get it
off, you are stripping away the outer layer of plastic.

> thereof. As long as each number was used once and only once...

You don't have to check numers itself. For example something like:

```
dim t(8)
for x=0 to 8:t(x)=x+8:next x
for x=0 to 8:y=int(9*rnd(0)/9):z=t(y):t(y)=t(x):t(x)=z:next x
```

VIM is a cleaning product that you can buy almost anywhere in North America. It is yellow in color, and is distributed in a yellow squeeze bottle. Not to be confused with mustard, which is a foodstuff. VIM is not edible.

Heat and ultraviolet light? Sort of reminds me of a pair of pants I once purchased from a store in Point Edward (Sharkskin). The clothing in the store sat on racks adjacent to an uncovered window. With the Sun beaming in on the fabric everyday, the clothing became Sun bleached.

As for the yellowing of the OP's Atari computers, I believe he said that the machines were packed away in the loft. If a loft is what I think it is, then I don't believe ultraviolet light would have been a principle cause of the discoloration. Most likely, the cause was just dust and dirt that has bonded to the plastic due to temperatures and poor air circulation. If this is the case, a cleaning product like VIM would probably go a long way in cleaning the plastic.

It would certainly be a better idea to attempt a cleaning prior to pulling out the spray paints. Don't ya think? :-P

I'll have to check into VIM -- had never heard of it before.

Incidently, my badly yellowed XF-551 was never exposed to sunlight.
But it did sit about 12" under a flourescent lamp -- the screw-in
incandescant replacement type. I've never used a flourescent bulb in
my computer desk lamp since. -Larry

Source record: 6535

Paul,

I can help on question 4 because I sell them! Both NTSC and PAL machines have the same pinouts on the monitor ports. Only the French SECAM versions use a different style of socket. However, your TV will indeed need to be multi-standard to handle the NTSC signals. Virtually all recent TVs (even the cheap 50quid portables) will be able to do this. Generally any TV made within the last 5 years will be multi-standard. Before this, only 'top-of-the-range' models would do it. You will most certainly need to connect the machine by SCART/RCA via the monitor socket, because even multi-standard TVs won't be able to accept NTSC over RF because the RF tuners won't be able to tune to the NTSC carrier frequency. I currently have SCART and RCA cables available at:

http://search.ebay.co.uk/_W0QQsassZdeangarraghty

On question 2, I would say you should have no problems. I actually run US 1050 drives on UK power supplies with PAL machines with no problems.

Hello All,

Folks are forgetting Screen Aided Management (SAM) from PPP Germany. I still have the license to sell this (English version), and I have it available on disk for the Atari, and as part of our DGS Atari CD-ROM. SAM won't work on the 800, though. It needs an 800XL minimum. It's an 80-column (done if software) GUI using an ST mouse or joystick to operate. Also ships with a spreadsheet, wordprocessor, and desktop publisher package all of which are integrated and use the mouse. Full details over at our website:

http://www.dgs.clara.net

Check out these links. This one is from homebasics.ca and offers some VIM cleaning tips: http://www.homebasics.ca/viewarticle.asp?articleid=2365

Here is the website of the Canadian distributer, Unilever: http://www.unilever.ca/ourbrands/homecare/vim.asp

VIM is distributed in Canada by Unilever. You can check out their website
at this link: http://www.unilever.ca/ourbrands/homecare/vim.asp

And here's some VIM cleaning tips from the homebasics.ca website:
http://www.homebasics.ca/viewarticle.asp?articleid=2365

I looked up VIM. There are about 8 versions, one with
bleach. I guess one of the Oxy kinds you're talking about.
Sounds good. I like 409 cleaner for cleaning old computer
stuff, monitors. It seems very good on the tobacco yellowing.

Actually, I've had good success with the cream cleaner. It's a little
messier to use, but it works exceptionally well. I used it on cigarette
smoke stains.

The name of the company that manufactures and distributes it is kind of
interesting as well. UniLever! If you take 'Uni' to mean 'one', and I
think you know what a lever is. So if you think back to the ancient
Greek, Archimedes, and his line, "GIVE ME A PLACE TO STAND AND I WILL MOVE
THE EARTH." You get some interesting perspective.

One lever to move the Earth. In this particular case, the lever is the
product VIM, and the Earth is a metaphor for dirt. So VIM from UniLever
moves the dirt from whatever it is you're cleaning.

I'm sure there is no relation between the distributer of VIM, and the
ancient Greek, Archimedes, but this little association will help me

remember this useless trivia. :-P

In my attic, heat would be the culprit..

But i might try this VIM stuff on an extra apple II duo drive i have
that had some yellowing before i even got it, so i don't know if its
smoke or light/heat..

We're really getting a nice little symbolic story line going here. From yellow computers to cleaning products, company names to ancient Greece, and from ancient Greece to weddings in Bolton.

Man and woman join as one, in a building that is home of the Lord, in a town that is the gravesite of the founder of UniLever. Weird! One union... One Lever... And a lot of Earth having been moved. Dirt from a yellow computer... and dirt from the ground where the founder of UniLever is buried.

Can you sell it on a floppy? It will be a while before I get a CD-ROM
drive for the Atari or Commodore, and I'm having a lot of trouble with
the CoCo's SCSI drivers.

> http://www.dgs.clara.net

The web site says the manuals are all in pdf format, but it doesn't say
where to get the pdf reader. Is it 800 compatible, or does it also
require an XL/XE?

You seem to be reading just the CD-ROM section of the website. If you click 'Product Catalogue' at the top of the screen, you will see the main catalogue. It is still available on disk with a printed manual. It needs an XL/XE.

Hello All,

I have new batches of Atari 800/XL/XE to SCART or RCA cables. These are currently being sold on eBay at a fixed price. Link is:

http://search.ebay.co.uk/_W0QQsassZdeangarraghty

Before anybody has a moan, yes I know people could make these cables themselves. But, there are many who can't for whatever reason.

Right, multitasker, not memory capture. I believe it didn't
allow multiprograms to be running at once, it just took a
'snapshot' of memory and alternated which program would
be running in the foreground. I believe it required 256 or 128k,
so no 800.
>> GOE? If you're talking Diamond GOS graphical interface, I don't know

> I said *Word Processor* not text editor.
Text editor, word processor, desktop publishing, integrated
publishing/spreadsheet/database, in that order. A text editor
will edit text and have limited capabilities, a word processor
for the A8 was like Atariwriter/Paperclip, with these you could
do underline, italics, bold, change the pitch and maybe even
select a font, move text ie. the capablities of a 9 or 24 pin printer, a
desktop publisher added the ability to put bit image pictures in the text.
Most A8 'word processors' didn't have spell check. Today's
'word processor' eg. MS Word are desktop publishing and
more features.
You seem to be thinking the A8 will do what MS Word will
do, with a GUI and mouse. Maybe Garrahty's software and
a ST mouse will do some.

Ha Ha Ha, The A8 can crash, does sometimes, maybe not as
annoyingly as MS Windows. But A8 mainly crash when you
know you're doing something stupid, like programming in
assembler.

I heard you could download while playing a game, etc. The CoCo can do
that, Commodore could but doesn't, Atari should but might not.

> I believe it required 256 or 128k, so no 800.

I haven't heard from the guy yet, so I might end up getting a 130XE.

> Most A8 'word processors' didn't have spell check.

Are you serious!? Most CoCo & Commodore word processors do. Does
AtariWriter? I'm pretty shure Paper Clip did.

> Today's 'word processor' eg. MS Word are desktop publishing and more features.
> You seem to be thinking the A8 will do what MS Word will do, with a GUI and

Why not? GeoWrite for the Commodore 64/128 does. Max-10 for the CoCo 3
does. The Atari 800 is a much better machine than the C=64, so why
shouldn't it have better software? Why shouldn't I expect the 130XE to
be at least as good as the C=128 and CoCo 3? They both run
multi-program windowing environments, graphical user interfaces, and
mouse-based software.

Every time I ask a question on comp.sys.atari.8bit, if I get an answer,
it's vague, incomplete, inaccurate, or just "I don't know but I don't
think so". What happened to all the nerds, experts, and programmers
from the Atari world? did they all go to another newsgroup or something?

I dunno.
It might be that you can do a download while playing a game
with snapshot.
I believe Atariwriter Plus, the disk one, had a separate spell
checker that you had to boot separately and run it on your
text file. I used a ANALOG one called speller. It was only
good if you had a dictionary for it. I believe somebody made
a good dictionary for it. I made my own dictionary for scientific
terms.
I used Paper Clip a lot, and I don't think it had a spell check.
Part of the vagueness is we're talking 20 years since I used
this stuff, and memory may not serve so good.

Talking word processors.
I just spent 10 minutes typing a response. Starting with
the fact there is a spell checker for Paper Clip, must be
the later one, a separate boot disk like Atariwriter.
My point is, this GUI, pointer using interface for newsgroups
I'm using right now (Outlook Express) mysteriously dumped
my typing, I don't know where it went, I start over.

7054. Re: G.U.I. based Atari Applications

WAIT! Here is my typing! It disappeared behind the OE
screen somehow.

I looked in my archives and indeed, there is a Paper Clip
spell checker. Like Atariwriter Plus, it is a separate boot
disk. At the time of these 'word processors', they were really
just a little more than text editors. They could send underline,
italics, and bold codes, 'printer drivers', and you could enter
codes to change the fonts and pitch for your dot matrix printer.
You could
'select and move or delete' sections of text. But no mouse, I
can't think of a joystick feature either.

You could do this with a program called Bobterm. It had a built in
game like breakout..

>> Most A8 'word processors' didn't have spell check.
>
>Are you serious!? Most CoCo & Commodore word processors do. Does
>AtariWriter? I'm pretty shure Paper Clip did.

Atariwriter plus had a spellcheck... I dont rem what other word pro
programs did.

>Why not? GeoWrite for the Commodore 64/128 does. Max-10 for the CoCo 3
>does. The Atari 800 is a much better machine than the C=64, so why
>shouldn't it have better software?

It depends on what you want to do. You have to remember that
development for the Atari 8bit slowed down in the mid to late 80's
while the Commdore 64/128 was still going full steam. There was a GUI
for the atari called Diamond OS and there is productivity software for
it but because of the lackluster demand for a GUI on the Atari8 it is
buggy and not very good. There have been other GUI's that have come
out for the Atari over the years, but Im not sure what the status is
on desktop publ software, prob not much.

Snapshot allowed you to use the extra memory of a 130xe or expanded
800xl to literally take a "snapshot" of what you were running, you can
then switch back and forth between different snapshots. It didnt
really multitask per say. Im not sure what use it would have
nowadays.

I hope this helps.

As I mentioned in a previous post I still distribute the English language version of Screen Aided Management (SAM) which is an 80-col mouse-driven GUI. This ships with a word processor, spreadsheet, graphics package, character set editor, and a DTP package called Designer. They're all designed to work together, so you can edit a document with the word processor and import the text into Designer. It can also be operated with a joystick.

It's available either on 2 disks with a printed manual, or as part of our CD-ROM collection (costs as little as $8.50 delivered to the US) which also includes all our other commercial software. For prices and info, see our site:

So.... there you have it, an integrated word processor, spreadsheet
and graphics publisher, with mouse or joystick interface.
All new and modern, from across the pond (assuming you are
on the west side of the pond.) And for $8.50 US dellivered
right to your door! Hmm.. I'd buy it, but I wouldn't respect
the copyright, probably, I'm such a wimp.

7060. Bonus Commodore Chapter Now Available

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-14 16:58:08 UTC
From: Variant Press <variant@commodorebook.com>
Message-ID: <p2Qtg.9003$w6.8772@newsfe18.lga>
Source record: 6417

This email is to inform buyers of "On the Edge" that the first bonus chapter is now freely available online. This chapter fits somewhere between Chapter One and Chapter Two, right after the 6502 development and before the Commodore acquisition. The content includes the early development computers by MOS Technology (and later Commodore) and the beginning of the personal software industry. You can download the chapter from www.commodorebook.com in the bonus section.

Readers of "On the Edge" can also benefit from an exclusive 10% discount on the brand new Amiga Forever 2006. The DVD set that is part of the Premium Edition of Amiga Forever has some incredible footage from the early Amiga days. To take advantage of this offer, which applies to all editions of Amiga Forever, order from www.amigaforever.com before July 31st, 2006, and enter "AFCBM" in the Discount Coupon field of the order form.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Hi gang.

Some exciting new material will be available at the Classic Computer Magazine Archive (www.AtariMagazines.com) soon, and I need some help finding source material to make it happen quickly.

First, I need archives of the ST-Log magazine software disks - specifically issues 18 through 36. If anyone has these or can point me to them online, I'd be grateful. (To clarify: I don't want physical disks - I need digital versions.)

Second, I need some issues of ANALOG Computing to scan (physical copies). These need to be issues that you don't want back, because I am going to tear them up to feed to a high-speed scanner. I need these issues: 60, 61, 65, 68, 70, 71, and 73-77.

If you have any of this, please contact me at www.savetz.com/contact/

Thanks
Kevin

7064. FS eBay: Atari XL/XE SAM 80-col GUI (reduced cost)

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-15 14:22:45 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1152973364.14856.0@proxy01.news.clara.net>
Source record: 6421

Hello All,

There seems to be some interest in a GUI for the Atari 8-bit, and as I've mentioned in other posts I am still able to supply Screen Aided Management (SAM). This is an 80-col environment (done in software), which can be controlled by an ST compatible mouse (or a joystick) and includes a word processor, spreadsheet, DTP, graphics editor, character set editor, a game, and some other stuff. I have put together a package including the manuals on a CD-ROM (in PDF format) rather than printed, which has reduced the cost of the package (2 disks and the CD-ROM) down to just 3.99pounds (+shipping: 1pound UK, 1.75pounds Europe, and 2.00pounds US/everywhere else). These are available on eBay now. Link:

http://search.ebay.co.uk/_W0QQsassZdeangarraghty

It is also available as part of our DGS CD-ROM software collection, which includes stacks of other software too. This costs from just $6.00 delivered to the US. I'm not allowed to sell these on eBay (they're convinced it contains pirated software, and won't let me offer evidence that they're not), so you can buy those directly from my site (using PayPal):
http://www.dgs.clara.net

I'm guessing you want a sector copy from one GT to a second
GT. You can use Disk Wizard II Backup for that.

Hi Jack-

Perhaps one of our European friends could comment if this was ever done with any drives such as Tom's or others were not marketed in the US? In theory, two US drives could probably be programmed to do that: the Indus GT *with the Supercharger add-on board* and the ATR 8000. But you would have to be very knowledgable about a Z80 cpu for either one. The closest thing that I am aware of for a drive operating in stand-alone mode is that a Rana in diagnostic mode can format disks without intervention of the cpu. -Larry

I am not 100% sure, but it sounds like a Happy Controller.
Does it have a LED as well?

The Happy Controller had a yellow LED attached to a small board
with the two toggle switches.

These had 2 toggle switches and allowed you to use the back
side of a floppy without putting a notch in the disk and allow
you to turn off/on write protect mode, also allowed you to
manually alter the speed of the drive if memory serves.

If you happen to want to get rid of it, then I may be interested.
I have a few 1050 Happy Drives and would like to get the
controller.

Mind you that everything the controller does, can be done with
software.

I should have mentioned that it could be a Happy Board with the
Happy Controller connected.

The Controller was optional and just plugged in with 2-3 connections.

Contact me if you happen to want to get rid of the whole thing.

I still read through this group but use Atari Age forums instead of
newgroups for no
spam and the ability to attach binaries and pictures without having to post
in binaries
group or a link. Also if trolling or flame wars get to bad, topics can get
locked and
people can get booted. That doesnt seem to happen too much though.

my 2 cents,
Ken

7071. 19 issues of ST-Log Magazine at AtariMagazines.com

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-17 21:59:47 UTC
From: Kevin Savetz <savetz-remove@gmail.com>
Message-ID: <savetz-remove-0187A8.14594717072006@news.west.cox.net>
Source record: 6428
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,alt.folklore.computers

July 27 will be the 10th anniversary of the Classic Computer Magazine Archive (www.atarimagazines.com). In celebration, today we're announcing that the site now offers the full text of 19 issues of ST-Log Magazine. This includes more than 600 articles and a gallery of the magazine's covers.
http://www.atarimagazines.com/st-log/

ST-Log was devoted to Atari's 16-bit ST line of computers. It began as an insert in ANALOG Computing magazine in 1986. It spun off as a separate magazine for about three years, before being folded back into ANALOG again in 1989. ANALOG and ST-Log were sold to Larry Flynt Publishing in 1988. The Classic Computer Magazine Archive has permission to share the 19 issues published by L.F.P., from April 1988 until ST-Log ceased publication in 1989.

In addition, AtariMagazines.com recently added a cover image gallery for Compute! magazine, with a nearly complete collection of covers from 1980 through 1988. (The site offers the full text of nearly 100 issues of Compute!.)
http://www.atarimagazines.com/compute/

The site launched July 27, 1996 as "The Digital Antic Project" with the full text of two issues of Antic magazine. The site was later renamed to The Classic Computer Magazine Archive and added articles from STart, Creative Computing, Compute II, Hi-Res, Creative Computing Video & Arcade Games Magazine, and Tandy Whiz Kids comic books.

Enjoy!

<snip awesome news about ST LOG && Compute!>

Congratulations and thanks for all of your (and others?) hard work! It's amazing how much content you've been able to digitize in such a short amount of time. You are ensuring this stuff will be around for future generations when the hard copies of this stuff have been lost.

7073. 800 XL for sale

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-18 15:07:59 UTC
From: mixingbliss@yahoo.com
Message-ID: <1153235279.183542.283540@h48g2000cwc.googlegroups.com>
Source record: 6430

Hello, fellow 8-bit users.

I have a well-preserved 800 XL system for sale, including a 1050 Drive, 1030 Modem, and 1027 Printer plus loads of software and accessories. I didn't know this usenet group existed or I'd have tried offering it here first. Unfortunately, I already set up an eBay auction for it:

http://cgi.ebay.com/Atari-800-XL-computer-system-w-drive-printer-modem_W0QQitemZ200008213722QQihZ010QQcategoryZ82631QQssPageNameZWDVWQQrdZ1QQcmdZViewItem.

I've had a number of offers from people who only want the processor or only want the games, but I'm hesitant to split up the whole package. I'd much rather see it go to a serious collector who would appreciate it.

Write to me with any questions.

Chad

I should have figured it was something like that. bit.listserv.coco was
spammed to death and abandoned. Now we talk about the world's best os
and second best hardware on a gmane group. comp.sys.cbm usualy has at
least one flamewar going on. I don't see why they put up with it.

Atari 8-Bit Computers: Vendors and Developers (Michael Current)
http://www.cs.uu.nl/wais/html/na-dir/atari-8-bit/vendev.htm

Above is a pretty comprehensive list. It may be difficult to
determine which one(s) have the items you mention, so,
I'll mention a few vendors:
Video 61, Bravo Sierra, B&C Computervisions, Best
Electronics all pretty extensive selections (google them).
And, ebaY has most of those items as well.

I'm from Europe, but don't have a Toms or any other 3rd party drives.
Only 1050s (with various extensions, Speedy, Happy, Turbo) and a
XF551.

With the original Atari-drives you can't do a direct drive-to-drive
copy, since you'd need to switch some of the SIO pins from input
to output (so that a drive can take over control of the SIO bus).

> In theory, two US drives could probably be programmed to do that: the
> Indus GT *with the Supercharger add-on board* and the ATR 8000.

Do you have any more information about that? This would be quite
tricky IMO, not because of the programming but electrically. If
a drive takes over control of the SIO bus this will most certainly
interfere with the Atari connected to the bus (eg the Atari driving
DataOut high and another drive trying to drive this line to low).

> The closest thing that I am aware of for a drive operating in
> stand-alone mode is that a Rana in diagnostic mode can format disks
> without intervention of the cpu.

The Speedy 1050 supports a similar command and, IIRC, even supports
writing a blank DOS2.5 directory. This command is used by the
Speedy HSS sector copier if you've got more than one drive: before
reading of the source drive starts an "unattended format" command
is sent to the destination drive. So reading and formatting are
running in parallel.

The drawback of this command is that you don't get any feedback about
bad sectors on disk. OTOH, the Speedy also supported a "fast format"
command that didn't do any sector verifies and thus finished in
9 seconds (instead of 18). Fast, but you'll have to really trust
your floppy disks :-)

so long,

Hias

The ST had a cable to do this IIRC: Printer cable that controlled the somewhat standard mechanism ~34 pin edge card connector of the 3.5" or 5.25" drive. You needed two drives to use it. The stepping from track to track was done with signals sent from the printer while the data out line from one drive was sent to the data in line of the other. Not sure about !Write lines or whatever.

It would be a tough nut to crack on an 8-bit. Maybe use the J/S port to do the timing/stepping with a couple of RANA drives but you would have to deal with the RPM difference.

Sure does - I've got one. The software/cable combo works like a charm. You
can back up just about any floppy disk - even copy protected ones. It
bypasses the floppy disk controller, if I remember right. :)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

7092. report on Midwest Vintage Computer Festival

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-23 23:25:55 UTC
From: Sid Pacman <8-bitter@atari.old.folks.home>
Message-ID: <Pine.GSO.4.61.0607231923040.11571@furyy1>
Source record: 6349

Here's a report on the second annual Midwest Computer Festival that took place last weekend at Purdue University.

A small crowd of about three dozen people attended on Saturday, July 15, a far cry from the prediction of 100 posted by VCF founder Sellam Ismail on the event website. It appears this show could use a lot more publicity.

On the plus side the Purdue campus and the library building where the computer show was held were easy to find. West Lafayette, Indiana, is near I-65, midway between Chicago and Indianapolis. The location is ideal and the one-day format well-suited for this event. Seminars were held during the first three hours, and the display & sales room opened at 1 p.m.

Having traveled for four hours from Columbus, Ohio (about 250 miles away), I appreciated the late starting time for displays. However, on the minus side of the event's organizing was an apparent deficiency in coordinating the event with campus authorities. After arriving in the library building itself, I lost 30 to 45 minutes because the exact room location wasn't posted anywhere: no signs in the building lobbies; no signs on the doors; no mention in the large events listing kiosk of the student union building; unknown to the library staff itself; and not listed in the library reference department's events calendar. (As a longtime organizer of hundreds of events, I notice things like this.) Worse, because of security reasons (for the books) some of the passage-ways and stairwells in the library building don't lead to where the signs imply, making matters more confusing for visitors. If this event is held again in the future, I hope the organizers will put up some signs to aid first-time visitors and late-arriving travelers.

I can't comment on the pre-noon seminar(s) since I missed all that, but the final seminar featured four people who talked mainly about their experiences with "big irons" computers dating back to the 1960s as well as amassing huge collections of old hardware. One said he collected "everything" and now had 24,000 cubic feet of "stuff." "Big irons" and purposeful collecting left their mark as the themes of this show.

Perhaps the most interesting and significant of the speakers was Jay West, who runs a website and "list" devoted to classic computers. The address is: www.classiccmp.org. He told this writer that there are 40 to 70 messages per day posted on the "list" (somewhat similar to this newsgroup). He also has a functioning HP2000 system running on original hardware, which he thinks may be unique. Based in St. Louis, he told the meeting that his goal is to set up a museum that actually runs the old systems.

Two other notes from the seminar: The website bitsavers.org was said to have lots of manuals and technical info on old systems. An amusing acronym was CACHE, which stood for Chicago Area Computer Hobby Exchange.

Moving on to the exhibits, Michael Lee had a great display of historical computing equipment, ranging from the abacus and slide rules of hundreds (or thousands) of years ago, to electronic computing and game-playing items from the early days of conveniently portable hardware for individual users in the 1970s and '80s. I also give him the best-dressed award for a T-shirt (found on E-bay, he said) which appeared to have the complete history of computing on it in the form of historical tidbits, cartoons, equations, and whatnot. His website is: www.geekmuseum.org.

Rory McMahon of the Chicago Atari club had an Atari Falcon 030 in a see-thru, clear-plastic case modded (that's his verb) with a CT60 accelerator. Unfortunately, he couldn't run it because it came close to burning out! Another cool mod (running an Atari 8-bit cartridge) had what looked like a 130XE keyboard and motherboard in a 130XE case, hooked to a flash memory card, and with a small color LCD screen attached to the case. If the Atari company were still around and putting out 8-bits, this is what they should look like! This nifty mod earned praise from several people. The website for the Chicago group is: www.scatarians.org.

In other 8-bit highlights, there was a music-player program (similar to Atari) running on a Commodore. One guy had an Apple 2 on the inside of a case Apple made for use in schools for students to use, but on the outside the case read "Hewlett-Packard." Since Apples weren't sanctioned by schools (or were considered toys), at one point the Apple company made a deal with H-P to sell Apple 2s this way. Also on display were upgraded Tandy CoCos, a NeXT Cube system (remember that? It was put out by Steve Jobs circa 1985 after leaving Apple), and the very first VT-100 computer.

Julian Wolfe had IBM's first "P.C." -- an IBM 5155 Portable PC, which came out in 1981 several months prior to the model called the "IBM PC." This display had a 2 MB EMS memory card, SCSI hard disk, EGA video board, and AdLib sound card running PC DOS 2000 and Windows 3.0.

Other exhibits included VAXstation 4000/60 and 3100/76, an Alpha Personal Workstation 433au running VMS with DECnet connected to a PDP11, a DECmate III based on PDP-8 architecture, an Atari STE, and KIM-1 6502 single-board computers and peripherals. (Don't ask me to explain any of this. I only speak Atari. <grin!> No, seriously, I also speak Unix, MS-DOS, and Windoze, and heard about ENIAC and Univac and Sperry and many other names back in the last century, but I take in a lot of this as merely ambiance.) There was also a lot of really old hardware and peripherals, much of it giant-sized (remember those!?), which was labeled as free for the taking! (It was still mostly there when I left.)

Now for the review: I would say this show was worth going to once, but I'm hard-pressed to come up with reasons to go back. A newsgroup like this one, for example, might decide to organize an annual meeting at an event like this since it's about as geographically centralized as

one could hope for. That could serve as an excuse to bring Atari people together in person. As I say, this is just an example. (It's also a hint!)

Other than that, my feeling is "Been there, done it." What's the point of future shows? What can be done to try to attract more people to show up, not to mention to attract back again those who've already seen it? What new themes can be devised for the future? What new displays can be rounded up? What new speakers or topics for seminars can be found? The organizers need to think about these questions and try to come up with answers.

Message-ID: <Pine.GSO.4.61.0607231927100.11571@furyy1>
Source record: 6350

On Wed, 12 Jul 2006 at 15:40 -0700, puritan_2076 scribbled:
->Every time I ask a question on comp.sys.atari.8bit, if I get an
->answer, it's vague, incomplete, inaccurate, or just "I don't know
->but I don't think so". What happened to all the nerds, experts,
->and programmers from the Atari world? did they all go to another
->newsgroup or something?

In itself, this is a fair question, altho the resident experts (those who are still around these days) are likely to bristle a little bit at your labeling their answers as "vague" or "incomplete" or "inaccurate." If you are so knowledgable as to be able to label their answers this way, one wonders why you asked any questions in the first place.

But let's get back to the point, which I labeled as a fair question in its own right. Well, obviously, many gurus of the past have left the Atari 8-bit scene now. Only a relative few have made old computers into a permanent hobby. (For that subject, see my other posting today on the Midwest VCF show.) As time passes, people will inevitably drift away from hobbies, especially if the subject of the hobby is considered obsolete.

There's also the reality (which has been pretty obvious on this newsgroup for many years) that almost everybody now does their Atari 8-bitting by emulation. That poses some practical limits on how exact they can be in answering certain questions.

The activity on this newsgroup goes up and down. But every question that's posted still gets answered by somebody. There's still a modicum of activity. Overall, I think the situation is okay. If questions are asked politely, they'll get polite answers.

3 Dozen? That had to be smaller than last year's show. I did attend last year's show and decided against going to this year's show based on what I saw back in 2005. When I heard it announced this year, I went to the website to find out what they were planning. Seemed to be no information to tempt me this year...had little reason to check the website the closer it got to show time.

The publicity seems to be about the same, I remember having a hard time trying to find the building it was in, let alone what floor it was on. For a student at that college, it might have been easy to know where you were going. For someone out of town who never stepped foot on this campus before, you had to be pretty desperate to search this festival out. That's even with the directions that they had on the website.

Will I go next year? If they tempt me, I might.

Guys, I'm not slammin' on anyone, and I guess its just my humble opinion, but I'd love to have gone last year, the year before that, the year before that, etc, etc,...

I work in a hospital and its hard to get off work. If there was one close I'd find some way to attend it, and I've been seriously thinking about trying to drive to one, say Ohio or so...

Just me, but the chance to talk and be with other Atari users...well, thats a golden opportunity if you ask me.

I remember one year actually getting off work, setting up the details (hotel, trip etc), for attending one of the ToadFests way back when. A co-worker was in a car wreck and I had to cancel my plans. Of course, they closed not too long after that. You'll never know how much I grieve not being able to attend at least one of those shows. Jennifer and Dave Troy were (are) the best.

Just a thought... :)

7106. Re: Family-Net BBS

Newsgroup: comp.sys.atari.8bit
Date: 2006-07-28 16:59:46 UTC
From: Sid Pacman <8-bitter@atari.old.folks.home>
Message-ID: <Pine.GSO.4.61.0607281255440.7262@furyy1>
Source record: 6363

On Fri, 28 Jul 2006 at 08:36 -0000, Greg Goodwin scribbled
-> Well, happy to let you know the Family BBS is still out there,
->and what I am writing from. The new IP is 70.104.17.96
-> Doc Clu

Tried it & didn't get anything. For a test I telnetted to the
Dark Force BBS & got connected right away.

I'm selling my collection , take a look at this :

http://search.ebay.com/_W0QQsassZpanamajoe2005QQhtZ-1QQfrppZ50QQfsopZ1QQfsooZ1QQrdZ0?

I can offer

- a Black Box + instructions, power supply
- 810 Floppy
- Stereo Blaster
- CX-85 Pad
- a sound sampler
- ...

Games

- M.U.L.E.
- Alternate Reality the City and the Dungeon
- Ultima 3 and 4
- Zork I, Ballyhoo, Moonmist and Seastalker by Infocom
- Plastron on Disk
- Dropzone on Disk
- Boulder Dash Construction Set on Disk
- a few rare EPYX games on cassettes, like Curse of Ra, Hellfire
Warrior, Jumpman
- a few SSI strategy games like Gettyburg

plus many more ATARI XL games and ATARI ST games

I am looking for a copy of the game that was printed in the April 1985 copy of Compute called Mindbusters for the Atari. I remember typing in this simple game and enjoying it alot when I was younger. I posted about this a few months ago and finally found the title (and the cover of the compute article it was from at: http://tinyurl.com/ouy8e)

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Tarkin wrote:

> Don't feed the troll.

Do you really think this person is a troll? Why do you think that? Is it because he/she posted a message asking about Atari vendors in a newsgroup that is flooded with spam from a particular Atari vendor? Or possibly because the message was posted in a newsgroup that regularly offers a rather comprehensive listing of Atari vendors?

Although, I suppose the dude could be legit. It's highly possible that this person is using a filter that prevents him/her from ever receiving the Bravo Sierra spam posts. And maybe the vendor list posted by Micheal Current is too long and difficult for Puritan to read.

Oh, maybe the item this person wants is not available at any of the vendors listed in Micheal's directory. Maybe this person is looking for other more obscure vendors that might have that rare and difficult to find Atari product?

Maybe it's an Atari vendor just checking to see if the Atari community is aware of his/her service? Or maybe he/she is just a troll.

Hi! I just moved into a new house and while cleaning found lots of old ('82-'83) video game stuff in very good condition. Mostly Atari games (10 w/ instruction manuals), one Coleco Donky Kong, a pair of Coleco controllers, two Radio Shack TRS-80 Color Computer 2, one Radio Shack TRS-80 Canyon Climber game, a flip top Atari game case and some misc catalogs, promo posters and a DC Comics Centipede mini-comic book. I am not familiar with the market popularity, but am sure I can get at least some peanuts for this stuff. ? I see Atari games on ebay for $.25 - $5, haven't checked on anything else yet. Can anyone help me determine worth? Is there a better marketplace for this than eBay? Any tips? I'd like to get it to the people that would enjoy/value it most.

Thanks,
Dwight

To get a fair value for your carts you would need to register with eBay
and then use the 'search completed items' option.

Most of the games, unless they are rare, probably won't sell for much.
Couple of disk based ones like a mint Ultima III sell for ~$100 if
everything is there.

If you can boot the computer and check for modifcations it might add
value to the system price. Things like modified operating system or
memory expansion are a definate plus.

There are some things that are valuble either because they make the
system work well, like a MIO or Black Box. Other things, like an
original Atari 800 with a Covus drive hooked up through the joystick
ports would probably be like hitting the lottery.

I sent Bill the ATR. I found it in the Holmes collection.

I guess I should have posted earlier so that no one duplicates the
effort.

Sorry!

Anyone have a working url with some instruction manuals to our beloved 8bit games? I have my original Ultima II disk, and many more sitting in front of me, but the instruction manuals are buried in a closet. A really large closet...

I know there used to be a couple of sites. I would be willing to set something up if someone has a stack of docs sitting around and nowhere to put them.
Isaac

UPDATES SINCE PREVIOUS POSTING:
2006.07.07 BAKTRA, TURGEN SYSTEM 2, mmSAP
2006.06.28 Mark Grebe, Atari800MacX 3.3
2006.06.28 Eric Parent, Memo Pad Release 2
2006.06.23 Draco, SysInfo 2.11
2006.06.23 MadTeam, MADS 1.7.3
2006.06.19 added: Ludovic Jacomme (Zx-81), PSPATARI 1.0.2
2006.06.19 Atari800 Development Team, Atari800 2.0.2
2006.06.09 added: Outland Quest Software
2006.06.07 Thomas Richter, atari++ 1.46
2006.06.07 Eric Bacher, Dis6502 2.2
2006.06.07 Draco, many updates
2006.05.29 removed: Jindrich Kubec (Jindroush)

------------------------------

Subject: Introduction

Conventions
-----------
```

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no
guarantees. Information of this nature constantly ages; therefore, the
information contained in this list is constantly updated. Please use the
latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Has anyone entered this contest? I see no updates on the webpage a
month after it opened. I would hope there would be some people
interested in it, but I know there are Very few ppl here that
are still interested in programming on the atari...

I used to program a lot using TBas and others; late 80s early 90s..
I conceptually like the idea of a programming contest and hope
there are some who are interested... tho some actual prizes would
be nice even if they are fairly simple in stature. Maybe first prize
would go to a fairly simple stature program?

.peace.
William

Hi,

I have a Dell UltraSharp 2407WFP 24-inch Wide-Screen Flat Panel
Monitor. Here is a link to the tech specs.
http://accessories.us.dell.com/sna/productdetail.aspx?c=us&l=en&s=bsdr&cs=04S2&sku=2407W4Y
.
It has single composite video port and three component video ports.

Is it possible to connect an Atari 800XL to the monitor?

Thanks,
John

I think by using the composite video in is the easiest.

The easiest solution for you is to use an Atari to composite video cable. I'm sure there are more vendors but below shows the type of cable I mean (see lower left of image).

http://www.best-electronics-ca.com/power%20guide.htm

Your monitor provides you with another option. That is an S-Video connection. This would provide a better picture than composite video. For the Atari 800, 1200XL, 130XE, and some others this is also and easy connection. One such way to get it is to use A8 A/V BOB, a video breakout device. It has typical audio, composite video, and S-Video connectors. One also needs patch cables, not included.

http://www.a8maestro.com/sites/mtgcat/proda8/advert-e1.htm

Unfortunately, there is a problem. You own an 800XL. Reportedly, 800XLs do not have one the signals at the monitor port necessary to an produce S-Video output. (Well, a few 800XLs might but most don't, AFAIK. Mine didn't).

This problem can be easily fixed but it requires a little soldering.

Below is a link to an article which describes how to improve the video quality of an 800XL (which is well worth doing in my opinion). Step 7 describes how to restore the chrominance signal (the missing signal). If you don't care about improving video quality then step 7 is all you need.

http://sog.com/atarimods/supervid2.html

Some people don't even bother with the resistor. (Personally, I'm curious why a 100 ohm resistor is used vs a 75 ohm resistor but that's an issue for another time).

Looking at the bottom of the 800XL motherboard you will know if the chrominance signal is not connected because one pin of the monitor connector does not have a trace leading to any circuitry.

Here is my advice.

- purchase A8 A/V BOB! This will give you Composite Video and Audio connections at the very least.

- Test the S-Video connection. If it works then great! You are done.

- If you get a black screen, a black & white only image, or a scrambled picture then most likely the chrominance pin on your 800XL is not connected.

- Fix the chrominance signal or just use Composite Video.

Good luck.

- Steve Sheppard

> The fact that he posted this question, changing 'atari', to
> several different groups.

I use a Tandy Color Computer 3 and a Commodore 128 (including CP/M) and I like Atari and want a 130XE. Why shouldn't I post the same question about all I'm interested in now that I have something (not much, but something) other than lint in my pocket?

> And has not, to my knowledge, acknowledged any of the replies.

I don't yet have the hardware to get Contiki into my C=128 or 130XE,or to connect them to the internet, or even a 130XE to connect. I have a job and don't get over here to use these public computers every day or have much time while i'm here.

And I'm no more of a troll than you are.

A generalization: Atari programmers, while intelligent and competent, are not a very flexible lot. All getting a bit older too so learning a new language, even if it is only an added 'compile' step is not their style. The label Prima Donna comes to mind.

Bill Wilkinson once said one of the problems with his business was fewer then 5% of the people with Ataris programmed so his market for tools like MAC/65 was really limited. When I reminded him of his estimate once he revised it down. I think it was something along the lines of only 5% of the 5% program in anything other then Atari BASIC. Apply that to the newsgroup and you can see why there is the lack of interest in Advan. Nothing against Advan, just the way things are and have always been.

> there are some who are interested... tho some actual prizes would
> be nice even if they are fairly simple in stature. Maybe first prize
> would go to a fairly simple stature program?

I'm kind of a Prima Donna myself. IMNSHO: All the "must have" type programs have already been done. Hard to come up with a better terminal program then BobTerm. We have several editors, spreadsheets, data base programs to chose from. There is no shortage of good games or demos.

I'm also pretty good in Action! and assembly. It would be hard to convince me to write in a slower language that needs to be there in some form on someone else's computer for them to run it. This was ~the same problem Turbo BASIC had. For that matter just about every language on the 8 bit had the same problem with a fairly large run time needed to execute even a 'hello world' type program. The ability to write stand alone programs and easy interface to assembly language was what tipped me in favor of Action!

Hello,

I have a question about Copyright.

Do you know, if the companies from the older Atari 800 Day have any
copyrights of their old games, e.g.
Lucasart for Rescue on Fractalus
Activision for Pitfall 2
and so on and on....

Are there any copyright for the music in these games ?

Is it prohibited, if these Files are offered to be downloaded in a
web-Site ?

In theory, copyright does still exist in all this software. The question is whether the copyright holders would be interested in pursuing a claim for breach of copyright. In reality, copyright (at least in the UK) has always been a surprisingly informal affair. It really comes down to money. If a few people decided to copy a 25 year old game, how much revenue would the copyright holder loose? Basically none, because the asset would have been written off years ago. However, the company involved may still have an interest in the game concept, in so far as it may be looking to release it again for a new format. In this case, they may be stricter about the 'old' versions. You will find that in many cases, the publishers didn't actually own the copyrights at all and merely sold the game under license. In other cases, the publisher only had a publishing license for a fixed period, after which the rights would revert to the original author. Finding out who exactly owns the copyright now could prove tricky. If a publisher has ceased trading, the copyright may in some cases revert back to the author, or in other cases it would be seen as an asset and would be used as so if the company were involved in liquidation/administration. It would then be sold to help cover any company debts. Again, finding out who owns it now would be tricky.

One thing is for sure: Assuming that the original publisher has no interest in the games, and that they would allow them to be copied isn't a good idea. You would need written permission and most likely a lawyer would need to draw up transfer of ownership papers. I believe some games have been offered for sale for as little as $100, but then their lawyers would want paying to do the transfer of ownership which would make it stupidly expensive. Posting games on a website would be illegal, but whether the copyright holder would want to pursue it is another matter.

well, i think all the information you got says it all.....

I have an 800xl and I pipe the video out to my 21" monitor.
I bought something called a "cheesebox" which converts video from/to
multiple formats.

Anyway, looks good - I'm satisfied. Are you just going to output the audio
to speakers?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I'd say this depended on where you lived :-) Here in Europe (especially
in the german-speaking parts) TurboBasic rapidly became a de-facto
standard. It was published in 1986 as a type-in listing in a special
issue of the german magazine "Happy Computer". A lot of people either
took the time to type it in or just bought the magazine disks to save
a few hours (like me :-).

So, basically, there was a very nice, new programming language that
was compatible to the standard Atari Basic (so everyone could just
switch to Turbo Basic without having to learn a new language)
but had a lot of extensions, was significantly faster and also came
with a compiler - and all that available almost for free.

OTOH Basic XL/XE, Action, ... - which are also very nice products -
were available but rather expensive. Only very few people bought
one of these carts but rather used TurboBasic instead - or just
went on and programmed in assembler.

Just checked: the special issue cost 14 German Marks whereas
MAC/65, Basic XE and Action (also reviewed in that issue) cost
some 250-300 German Marks (back in 1986, the good old times...)

so long,

Hias

7145. Assembler Editor vs. Editor Assembler

Newsgroup: comp.sys.atari.8bit

Is there any difference in the software between these two Atari carts?
From what I can tell, it appears that the Editor Assembler cart (no
copyright date or part number) is simply the original release of the
Assembler Editor cart. Can anyone confirm or correct this assumption?

Thanks

I didn't know there was such a cart. I purchased the "Assembler
Editor" cartridge, CXL4003, in 1980. The copyright notice is listed as
1979.

There is an earlier cart?

Well folks, my ISP is killing me. I've got a dynamic IP address, which has been very stable for 2 years. Maybe 3 address changes in that time. Now, for some reason (techs are clueless as to why, but generally opinion is that its *my* fault), I've had multiple IP address changes in the last 3 or 4 days.

I asked about a business account, looking for a static ip address. I'm still waiting for the rep to return my call about that.

I've created an account with dyndns. I've got a perl script (ddclient) setup on my main linux box thats supposed to retrieve my ip address everytime I boot up, and every 5 mins thereafter, and update dyndns. Assuming I've got everything setup correctly.

SO if everything is working like its supposed to, everyone should be able to telnet into:

darkforce-bbs.dyndns.org

Please let me know if there are any problems.

Thanks everyone, and sorry for any inconvenience.

I dont know the TOS of dyndns, but make sure your ip has actually
changed before updating... Someone had told me if you keep submitting
an unchanged address, it somehow violates TOS, which may or not create
connection problems for you and users.

Rory

Yes, dyndns mentions that - its considered "abuse". The perl script I'm
using is only supposed to send an update to dyndns if there is an actual
IP address change.

FWIW: When I picked up an ASM/ED cart at San Jose Computer they had revision A for ~$5 and revision B for ~$20. I'm pretty sure they were both bare bones circuit board with ROMs and no case.

I bought the rev A of course, being a notorious cheapskate. When one of the 4k ROMs started going south on me I managed to get a clean copy and burn it into a 8k ROM.

It would be hard to imagine a slower assembler then my rev A. Seems to sit there thinking for a few seconds then proceed with what looks like a 300 BAUD compile.

ASM/ED is dog slow!

I didn't do much assembly programming but if I wrote anything larger
than say 100 lines of code I was probably using Synapse SynAssember
which was very fast.

Hi,
Is there a good solution for using a PC keyboard with an Atari
Emulator. I've search and can't seem to find a keyboard template or
overlay. I must be missing something. Any suggestions.

Thanks,
John

What do you need your keyboard to do?

If you are using Atari800Win Plus you can call up any template and edit it to your liking. There should be a couple sample templates under the \atari800Win\keyboard folder.
Granted, it's a lot of work to edit a template and the Atari800Win Plus keyboard editor is not very user friendly.

Personally, I prefer to opt for NO template since after all these years I'm most familiar with a PC keyboard. One nicety I like is the Atari800Win plus option to use CTRL + arrow keys. This allows me to use the PC cursor control keys instead of trying to remember that CTRL + '=' is the down arrow, CTRL + '-' is the up arrow, etc.

Interesting! I'm very suspicious of the wording "for all 8 bit Atari*
Computers"!

I can't imagine anyone, Atari or otherwise, using that phrase until
after the existence of the 520ST, at which time Atari would have both
8-bit and 16-bit computers.

I think the cart is knockoff, and a bad one at that. Open it! There is
probably an EPROM in it.

The silver lining was it created some good habits in me. I used to test
code after just about every line entered. After working with the ASM/ED
cart I started writing routines that actually did stuff before I would
test them for a clean compile. Amount of code I wrote before I would
compile usually dovetailed closely with bathroom breaks or getting
something to eat. I'm still the Oscar Madison of programming but I
forced myself to write cleaner code to avoid all the errors I used to
let in.

LOL! The "Oscar Madison" of programming, I don't know about that?
However, you are a creative writer. Not many would have combined the
words, "compile", "dovetail", "bathroom break", and "eating" all in one
sentence.

Anyway for me it was compile (or assemble) and get a cup of coffee.

There were far fewer coffee breaks when using SynAssembler and Action!
(and Turbo Pascal on the PC). Just not enough time! Darn, those fast
compilers!

REV A or just any version? I'm pretty sure there are ones up on some of the current web pirate/archive sites.

I know I eventually made mine into a binary run file which I am pretty sure my son uploaded to a pirate BBS to ingraciate himself with the owner back in the day.

My load file was set up right, should run on anything. If you pick one off the archives that doesn't work on an XL but does on an 800 it was probably made with CARTCOPY. Still usable with either an 800 or emulator in 800 mode of course, but if you want to fix it, it's just a couple of bytes different.

Is it just me, or do the old Atari Joysticks actually seem much easier to use, especially on fast action shoot 'em games?

One would think that someone out there would have created a nice small atari style joystick for the PC now days, but all I see are those big clunky pilot style joysticks which seem to slow the rapid movement needed in fast games.

I know of the adapter to make an Atari Joystick work for a PC, but are there actually any simple and small atari-style joysticks out there for the PC?

Let me stop you here. It was a joke. Maybe
you don't think your posts were suspicious,
but they were, at least to me.

> > Cheerios,

> You're British, aren't you? Your country deserves better.

Check out my ramblings on comp.sys.sinclair
in threads:
"OT: Philosophical Ramblings" &
"OT: Penny in plural"

Most of time, when I start blathering on in a thread,
it grinds to a halt. Thus my joke about being the
'thread killer' [note: mostly only is c.s.s anyway]

Besides that, Cheerios is an American breakfast
cereal; few, if any, Brits under 70 would ever actually
say 'cheerio', never mind 'cheerios'.

So, if you're jobless, how do you propose to pay
for the hardware you're asking these nice people
about?

Guten Aben,
Tarkin

I used to love those old Atari joysticks. The last one I had, had a broken plastic ring around the base of the stick. So when I really got into playing, the rubber would keep sliding off. It was quite a spectacle. The rubber would move up and down the stick if I motioned the stick with too much force in any given direction.

The fire button on those sticks were a thumb killer though. I remember getting cramps in my thumb from pushing my car to the gas pump in Great American Cross Country Road Race.

All in all, the old Atari joysticks were probably the best I've ever had. When I purchased my Mac and bought a Gravis Mousestick for it, the feel just wasn't quite right. So I know what you mean when you say that modern joysticks just don't offer the same playability. Oh well...

Here's a look inside:

http://www.slor.net/a8/edasmopen.jpg

Looks pretty typical. What's the best utility for getting an exact dump of
the cart? I've tried a couple different utilities I've found in my
archives, but the ones that work seem to add header crap and such to the
images. There must be one out there that will simply dump the 8192 bytes
exactly as the are on the cart.

I would have used omnimon to dump it. But I think DOS 2.5 just use
the BINARY SAVE option, and specify A000,BFFF. It will put
a 6 byte header on it FF,FF,00,A0,FF,BF I think, which you can
just delete from BASIC like so:

```
10 CLOSE #1:CLOSE #2
20 OPEN #1,4,0,"D:DUMP.FLE
30 OPEN #2,8,0,"D:ROM.FLE"
40 TRAP 100
50 FOR N=1 TO 6:GET #1,X:NEXT N
60 GET #1,X
70 PUT #2,X
80 GOTO 60
100 TRAP 40000
110 CLOSE #1:CLOSE #2
```

That should give you just the ROM dump, 8192 bytes. Of course
the binary saved file wouldn't work because screen memory and
display list needs to be moved below A000 before loading A000-BFFF.

I dumped it using DOS 2.5 as suggested and then removed the first 6 bytes
in a hex editor, and here's what I found:

- Compared with my Assembler Editor cart (single chip variety), almost all
bytes of the image differ (over 7336 mismatches).
- Compared with the "Assembler Editor (1981)(Atari).rom" that is included
in the TOSEC cart set (also found in the Holmes archive), only one byte
differs: offset 1B52 contains 43 instead of A2.

I would compare with another 2-chip Assembler Editor cart, but the only one
I have is broken. I'm assuming my 1-chip Assembler Editor cart would be
the later version of Assembler Editor and the image I already had would be
the earlier one. Any idea what the single byte difference would be between
the existing image and this cart?

Paul Irvine compiled the complete Omnimon documentation, thanks
to him from across the big water. But here's a command summary
that can get you started. I'm not sure where to get Irvine's MS word
and ASCII text documentation. I have it. But here's the synopsis.
(Ah but wait, you use the W command, just jump down there and
read it. BUT, it doesn't tell you how to get the sectors you dump
off the floppy. That requires a utility to dump sectors to a file.
I also have my own utility to do that. In short it isn't all easy and
straightforward. But wait... again. If you want a simple binary load
file of the ASMED cart from your dump, you need to pre-pend a
brief ML file to move the display list and screen memory and HIMEM
down under A000 before you load A000-BFFF.)
Finally:
Omnimon Basics
Enter Omnimon:
SELECT/RESET
OPTION/SELECT/RESET (always use this
if entering from BASIC)
JSR $C001 or X=USR(49152)
Will enter Omnimon upon any encounter
with a BRK instruction.

Once in Omnimon:
PC NV-BDIZC AC X Y SP
Program counter, status registers,
Accumulator, X reg, Y reg, Stack
pointer.

Leave Omnimon, return to program:
Hold START, hit RETURN, use D to
set PC first.

```
Command Summary:
A: Alter Memory: A addr byte byte... -
Used to change 1 or more contiguous
bytes of memory.
B: Boot Disk B - Will boot off of the
selected drive.
C: CPU Registers: C - Used to
display and alter the registers.
D: Display Memory: D (start addr) (
End addr) - Used to view memory data.
To alter memory, position cursor and
type change.
E: Execute Memory: E (option/=steps)
- Will execute one or more
instructions at a time and display
intermediate results.
F: Fill Prgm Buffer: F addr - Teach
monitor a sequence of commands for
later execution with the 'O' command.
G: Get File: G (filespec) (addr) = A
full binary load function, single or
double density. Doubles as disk
directory command.
H: Hex Arithmetic: H= (= oper) (=
oper) ... - Hex conversion allowing
addition, subtraction, multiplication
and division.
J: Jump Subroutine: J (addr) - Go
execute subroutine.
L: Link Drive: L (drv=) - Select
drive = and linked or sequential
sector modes. All disk I/O will go to
the selected drive.
M: Move Memory: M addr0 addr1 addr2
= Move a block of memory from anywhere
in memory to anywhere else.
N: Relocate Memory: N addr0 addr1
addr2 (addr3) (addr4) = Adjust 6502
code that it will execute in another
location.
O: Operate Prgm Buffer: O addr =
Execute the commands stored earlier
with the 'F' Command.
P: Printer Control: P - Screen I/O
and be echoed to a printer.
R: Read Disk: R (sect=) (buff addr)
(=sects) = Read one or more sectors
from selected disk drive into a
specified buffer area. See W for eg.
S: Search Memory: S addr byte byte
... = Search memory for and print out
```

occurrences of a sequence of bytes.
T: Toggle Format : T = Toggle between hex and character formats.
V: Verify Memory: V addr0 addr1 addr2 = Compare 2 blocks of memory and print out the differences.
W: Write disk: W (sect=) (buff addr) (=sects) - Write one or more sectors to disk from a specified buffer address. eg. W 1 A000 40 (writes 64 decimal sectors, dumping $A000 to $BFFF to sectors 1 to 64)
X: Disassembler: X (addr0) (addr1) = Translate machine code into assembly language. Can be used to create a source file.
Y: Assembler: Y addr instr - Translate assbly lang. into machine code one line at a time. Usefull for patching programs.

That, plus the kids today are somehow wrong-handed. I'm used to fire
with my left thumb, controlling the motion with the stick in my right.
Now see what a modern controller looks like.

Oh well, right, shooting is of course more important than
controlling.... =:-)

> One would think that someone out there would have created a nice small atari

I'm still with my atari joysticks here. Actually, Competition Pro's, one
of the best ever made, IMHO. I've them connected to the PCI, it's a tiny
little adapter, plus some software to be patched into the Linux kernel.
Works very well.

> I know of the adapter to make an Atari Joystick work for a PC, but are there
> actually any simple and small atari-style joysticks out there for the PC?

If I remember this correctly, I've seen something like a Competition Pro
with a USB connector, probably.

So long,
Thomas

Well, state what you need and I'll consider this with the next release of Atari++. My current solution is to map the alphanumeric keys to the equivalent atari keys, the Fn keys to the console keys and the cursor keys to the corresponding CTRL-combinations of the Atari, so you can type just natural.

Thus, lemme know some ideas.

So long,
Thomas

Actually, I believe he said that he was no longer penniless. More accurately, he said that he now had more than lint in his pocket -- but not much more than lint. In other words, he has a bit of spare change jingling around in his pocket, and he wants to spend it on some 8-bit kit. ;-)

Gute nacht,

Linux User

Which is why he shall remain jobless: instead of investing in a
nice crisp Oxford shirt and slacks, and using those public
(library?) computers to search job listings, he chooses instead
to shop for 8-bit kits. Perhaps I am too critical. Perhaps not.

Still, I believe c.s.a.8 periodically posts it's vendor's list, and
also
includes said list in it's FAQ. Which still makes the posting
suspicious.
Of course, I'm no web-saint 8^p

All of youse guys are so nice. That's why I like ya'.
Hmmmm.....it might be time for me to post on topic, instead
being a reactionary pr*ck :^)

Ciao,
Tarkin

Ah yes, and the public (library?) computers could also be used to search Google for Atari vendors, browse eBay for Atari items, or post a 'wanted' message to c.s.a.8.

> Still, I believe c.s.a.8 periodically posts it's vendor's list, and

> Of course, I'm no web-saint 8^p

'tis true. Micheal Current does indeed post the Atari Vendors list to the group with some regularity. Bravo Sierra, an actual Atari vendor, even spams the group from time to time with commercial solicitations. Bravo Sierra is even mentioned in said vendors list, and maintains a website that is easily located via Google or MSN Search.

The order of the words "Editor" and "Assembler" sounds as if it was French
of something. I do not speak French, but I could imagine the phrase

assembler editor

could be something like

l'editor d'assembler

in French. I suppose you see what I mean. Since the other printed text on
the cartridge label is in English according to a follow-up post in this
thread, the connection to French is probably just a speculation.

Anyway, here is a couple of links to lists with software items among which
one can find both "Assembler Editor" and "Editor Assembler".

The best way to get a RAM resident ASMED is to just leave BASIC enabled so far as the system is concerned.

I wrote a binary header which sat just under the DList. It used CASINI and used Shift to switch between ASM/BASIC.

Aside from that, you just need a throw-away routine at the start of the file which switches out BASIC for the load operation.

pre-XL would be trickier, have to retain a copy of $BC00-$BFFF somewhere.

Before I had a disk drive, I wrote a custom SIO routine which did a high baud-rate save of the 8K in a single block (after single block boot-code). Sped the load time up by about 50%.

I wasn't really after the image to use, just interested as to any differences.

I agree with you on the latter. On the former, liking the Gravis gamepads, I can not offer any semblance of agreement. I have never liked gamepads at all. Although, I will admit that the original NES gamepads were kind of interesting. I'm not saying that I liked them, just that they were interesting.

The controllers that Atari released with the Jaguar, were a disaster. I cannot, for the life of me, fathom how any serious game playing could be accomplished with those oversized burdensome button-laden devices. The Xbox controller is another that I find to be much too cumbersome. But that's just one man's opinion. :-)

Perhaps we're not talking about the same controller? I'm talking about the
one depicted here:
http://www.atariage.com/controller_page.html?ControllerID=21&SystemID=LYNX

A picture's worth a thousand words, I hear. This picture has disaster
written all over it. As a matter of disclosure, I will admit that I've
only ever held the Jaguar controller in my hand once. I didn't play with
it for very long, and I found it to be most awkward and cumbersome. But
like I said in my OP, this is just one man's opinion.

Well, I've got 2, for my Jaguar, even works with the STe and Falcon for
certain games. I guess its like you said, its just opinion, but I just
love mine. Always loved playing Doom with it, and many others.... :)

I see where Samsung says he knows about the Atari joystick-to-USB adapter but it is probably worth linking to PixelsPast (who make it I think) and to lik-sang.com (who sell it). Here are the links:

http://www.lik-sang.com/info.php?category=0&products_id=7899&
http://www.pixelspast.com/products/

AtariAge used to sell it but it's not listed there anymore that I can find.

Note: I am not recommending this product because I haven't used it (it looks good though).

And that's all that really matters. As long as you're happy with what you have, what other people think is really of little consequence. For the longest time I had to endure the condescending comments of PC users about my Macintosh preference. In high school, I was a staunch supporter of the Atari ST computers, though everyone I "evangelized" -- to steal a term from the Apple world -- maintained that the ST was crap.

To my credit, I did manage to convert two people to the ST way of doing things. One of these two people even went out and got himself an 800XL as well. I suppose, realistically, you could say that I converted three people, as I sold my own 520ST to a person that had not previously used or owned an Atari computer.

I even managed to convince one Commodore crony that the ST had better graphics than the Amiga. How I managed to do that, I'll never know... but what the hay? Only wish he had chosen to buy an ST over an Amiga. :-(

I don't do much evangelizing anymore. When I made the switch from Atari to Macintosh, I just sort of wallowed in my own knowledge that I was using superior technology, so I didn't get too much into the "convincing" mode as Macintosh user. Though I did manage to convince one person to buy a Performa 580.

Now I've pretty much abandoned the Macintosh OS in favour of GNU/Linux. I'm quite happy with Linux, even though I'm running it on an Intel-based machine -- something that I once maintained I would never own. ;-)

Ah, but the times they are a-changin'... As Bob Dylan once wrote, and Steve Jobs once quoted...

Howdy *,

I heard that there was in an old issue of Analog or Antic a tool which
was like a MyDos dup.sys replacement. I don't like the menu-driven
approach very much, so I prefer to have a powerfull command line.

does such a programm exist?

\twh

I never heard of a CLI for MyDOS. You don't want SpartaDOS/FTeDOS?
There are a few others BWE DOS and maybe another CLI one.

I'm currently using SpartaDOS and I feel it is too incompatible for my
requirements (music, graphics, demos).

Somebody told me to use Tom's Navigator as a replacement, but I prefer a
80 column bash-like command line. Would be cool to have something like this.

Hi Thomas,

Hmmm... I guess what I was thinking more along the lines of a physical solution, a PC keyboard with custom key caps, a way to use an actual Atari keyboard, or simply an overly template for a PC keyboard.

The actual Atari keyboard is the idea I like the most from an aesthetics standpoint. I've seen the MacFalkner web page that outlines how to connect a PC keyboard to a 130XE. I have not seen anything that goes the other way and lets you interface an Atari keyboard to a PC Emulator. That may seem backwards, but using an Atari emulator saves you a lot of desk real estate.

Anyway, I was just curious to see if anybody had any thoughts on this.

John

In the last box of Atari 8-bit stuff that I bought, there was a DOS from...
Actually, I can't remember the name of it offhand, but the tan colored
manual was for the Apple II and Atari 8-bit computers. I think it was
OS/A+ or something like that. I think it was a CLI DOS, but it was old.

I'm not familiar with the dup.sys replacement that you're referring to.
Sorry.

An 80-column BASH like command line for MyDOS? Good luck. But let me know
if you find one. Is MyDOS even scriptable?

I remember this DOS it came standard with Percom drives. It was CLI
based, and i believe (tho
I am not 100% sure) the next version was called DOS XL or something
like that... anyway I rem
it wasnt as good as Spartados, but I believe it did support double
density since Percom had one of the first DD drives for the Atari

SpartaDOS incompatible..... The main incompatiblilty I can think of
is you can't use the RAM under the OS, which eliminated classic
Turbo Basic, but I would guess you're using some assembler or
Action!-like development program. I don't know 'bash-like', sounds
like maybe something from Linux. Have you thought of a cross-assembler?
You can develop on a PC with it, that would give you your 80 columns.
80 columns on an Atari has never been very satisfactory.

There is one program I know of called MyDOS "Batchfile Enhancement" by Torsten Karwoth. It was mainly designed to allow you to run batch files from MyDos similar to MSDOS, but it does actually function as a somewhat usable but limited CLI as well. If you can't find it online, send me your email address and I can send you a copy (but I will be leaving town tomorrow and may not be able to reply until this weekend.)

One or both of the guys that were BBK did a CLI: Bryan Schappel, Barry Kolbe. I don't know if it was for MyDos or Atari DOS only.

http://www.schappel.com/8bit/ If you want to try it.

Connecting your Atari 8-bit to a PC just to use the Atari keyboard would be somewhat defeating the purpose of using an Atari emulator in the first place. If you're going to have a real Atari 8-bit on your desk, why not just use the real McCoy instead of the emulator?

Of course, the XEGS did have the detachable keyboard that you could probably somehow interface to your PC. I would guess that you'd just need some means of converting the XEGS keyboards keypresses to PC understandable scancodes. But that would seem like an awful lot of bother for very little benefit. Oh, and you wouldn't get the extended Atari keys, like Select, Option, etcetera.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

The nice thing about spare change is that it's spare. Unfortunately not
every american is a corporate executive with a thousand dolars in spare
change.

> Which is why he shall remain jobless: instead of investing in a
> nice crisp Oxford shirt and slacks, and using those public
> (library?) computers to search job listings, he chooses instead
> to shop for 8-bit kits. Perhaps I am too critical. Perhaps not.

I am not penieless or jobless. I have a pretty good job, not perfect
but good. I said I didn't have much more than lint in my pocket so
people who had cool stuff to sell would'nt think they coud get hundreds
of dollars for it. I'm not so rich I can just throw money away on
collectors items, so I made it clear I'm looking for stuff thats
reasonably priced. Like a near-new condition 130XE with an 850, two
XF551's and some software.

So go back under your bridge and leave those poor people on
comp.sys.cbm alone. Even Atari-wannabee users deserve to live in peace.

7216. Add money to your Paypal account with OPRAH ypG.K

Newsgroup: comp.sys.atari.8bit

From: NSI <af.irani@afyhpami.com>
Message-ID: <KIuEg.44298$vj1.31591@bignews5.bellsouth.net>
Source record: 6223

Read this message until the end, and you will find out how the money flows in easy !!!!.
Follow the steps and it WILL work. Trust me !!!!!.

It's NOT illegal and it is NOT a scam !!!!!.

PROVEN ON OPRAH! Reported in the Wall Street Journal!!!!

The only thing you need is : - E-MAIL ACCOUNT
- PREMIER (FREE) or BUSINESS PAYPAL ACCOUNT
- $6 on this account (The only investment)
- 30 minutes of your time

There is no limit on how much money you can recieve, and you haven't got anything to lose with this Business program. I will explain how it works !!!!!.

Follow these 4 easy steps and it WILL work !!!!!.

STEP 1 : SIGN UP FOR A FREE PAYPAL ACCOUNT !!!!!.

Paypal is a free and safe way to pay and receive money on the Internet.
Creating a account is as easy as creating a MSN account.
Copy and paste the next line in your Internet browser and sign up.
HTTP://WWW.PAYPAL.COM

Be sure to sign up for a FREE Premier or Business account and not for a Personal account. You cannot receive CREDITCARD payments with a Personal account and we can't have that. Do we !!!!!.

STEP 2 : SENT $6 TO YOUR PAYPAL ACCOUNT

This is your only investment to receive the money with ease.

With your Paypal account, send $1 to each e-mailadres listed below.
!!!!! IMPORTANT !!!!! Be sure to use this SUBJECT : *PLEASE PUT ME ON YOUR EMAIL LIST* when you send the money.

1) martine@pilote.net
2) dexxatol@netcourrier.com
3) armygirl8568@hotmail.com
4) comjii@starband.net
5) sinnek@bellsouth.net
6) nsi@nelasat.com

STEP 3 : PUT YOUR E-MAIL ADDRESS ON THE BOTTOM OF THE LIST

After you have send $1 to each e-mail address, put your e-mail address on the 6th place.
Remove e-mail address number 1, and move each e-mail address 1 step up the ladder.
!!!!! IMPORTANT !!!!! BE SURE THAT THE E-MAIL ADDRESS YOU USE IS THE SAME AS YOU USED TO SIGN UP AT PAYPAL.

Remember that this is LEGAL. You are creating a service : an e-mail servicelist.

STEP 4 : UPLOAD OR COPY THIS MESSAGE TO NEWSGROUPS, FORUMS ETC AND EMAIL IT TO ALL YOUR FRIENDS!

There are 32,000 newsgroups. Upload or copy this message to at least 200 newsgroups or forums etc, but ..... remember that the more your upload the more people will see your message and the MORE MONEY WILL FLOW IN.

How to upload to newsgroups and forums? :

After you have followed step 1,2,3 and 4, save this message (and copy so you can use it again).
Use your Internet browser and Outlook Express or another newsreader and try to find FORUMS, NEWSGROUPS,
BULLETIN BOARDS, DISCUSSION GROUPS, CHAT SITES and ONLINE COMMUNITIES. Use GOOGLE or use a NEWSERVER.
Use every option to post this message. Download PostXpert to send 1 message to more NEWSGROUPS at the
same time.

!!!!! REMEMBER !!!!! The more you post this message the more MONEY WILL FLOW IN.

Why does this Business program work so well !!!!!.

Lets asume that from the 200 (or more) messages that you have posted, only 5 people respond, you will have your
$6 back that you have invested. Those 5 people will each send at least 200 messages with your e-mailadres on
number 4. That's 6 x 6 x $1 = $36. The next 25 people will also send 200 messages with your adres on number 3. That's 36 x 6 x $1 = $216. The next 216 people also send 200 messages with your name on number 2. That's 216 x 6
x $1 = $1296!. Those 1296 people again also send 200 messages with your name on number 1. That will give us a total of 1296 x 6 x $1 = $7,776.

Now the last tier! 7776 x 6 x $1 = $46,656!!!!!!

This is only a EXAMPLE with 6 reactions. You WILL get MORE responses than that.

Remember that most newsservers will leave the posted messages on there servers for about 2 weeks. If you will post your message again, it WILL again start from the beginning. So you can repeat this over and over again.

Everyday MILLIONS of people are ONLINE and reading these messages, JUST LIKE YOU RIGHT NOW. I also was sceptical in the beginning and have read a lot of these messages. I also thought that it was bullshit.
Until I thought : What the hell!, only $6. What's $6 and a couple of minutes of my time to solve my money problems.

!!!!! REMEMBER !!!!! Follow every step, and IT WILL WORK, TRUST ME. !!!!!

!!!!! BEST WISHES AND GOOD LUCK !!!!!

w)O>+;)<9UVS;F>qaGL<Uq#v`V6(F]- rM;$g+!4IIQ*827?H4

Uh, I'm not british. I live in a little town called Sarnia. It is located in the southwest portion of Ontario, Canada, and borders Port Huron, Michigan. With a population of approximately 73,000 people, Sarnia is well known for its "chemical valley" and petrochemical industry.

During the second world war, Polymer Corporation was built in Sarnia to produce synthetic rubber for the war effort. Several major oil companies also have refineries in Sarnia. Among the major oil companies that operate refineries in Sarnia, are: Imperial Oil (Which is majority owned and controlled by Exxon/Mobil), Shell, and Suncor. Nova Chemicals, Bayer, and Dow Chemical also have operations in Sarnia.

Sarnia is one of the main economic arteries that facilitate trade between Canada and the United States. There are two international bridges spanning the St. Clair river linking Sarnia and Port Huron. Additionally, there is a rail tunnel that is used for both passenger and freight movement beneath the St. Clair river.

Several bingo halls once operated in Sarnia that attracted many Americans looking to win easy money. However, many of these bingo halls have gone out of business since the opening of the casino in Point Edward and the addition of slot machines at Hiawatha horsepark.

Sarnia was once home to NASA astronaut Chris Hadfield and one-time PGA Masters champion, Mike Weir. Sarnia also hosts the annual Bayfest Music festival and the annual winter Celebration of Lights.

About the only true negative that Sarnia stubbornly tolerates, is the operation of our three local radio stations by the facist Blackburn Radio Incorporated regime. Efforts are underway to have this regime removed from the community.

--
--
There are several things that I will never be:
* I will never be attracted to females.
* I will never enjoy the company of others.
Exactly how these realities bode for my enemy, is not of my concern.

7219. Down until further notice... :(

Newsgroup: comp.sys.atari.8bit

Well folks, I've got some bad news.

The DarkForce! BBS is down until further
notice.

The Mega STe that I've been using to run
the board has apparently suffered another
power supply failure. Thats the 2nd one
in about 4 months. I had replaced the
first one with a used one off Ebay. As
far as I can tell, thats the problem.

The Mega ST that I usually use is down
until I get the MFP chip socketed so I
can try the RSVE upgrade I've got.

So I'm left without an operational ST to
run the board for now. As soon as I get
enough funds saved up, I'll either get
the Mega ST repaired, or get a new P/S
for the Mega STe.

I'm sorry for any inconvenience... :(

Is there anything we can do to help?

Chris (Exxos) and I maybe able to repair your PSU's. Find out how much
they'd cost to ship to the UK??

Mmmm. You might be able to codge an PC ATX power supply even.

Hrmm..
I might have some donations I can make. Let me check my stock. Remind me
if I never follow up on this as I'm forgetful as you can get :-P

Thanks,
Mark

So noted. I apologize. Note that I am not a 'corporate executive', and,
now that you have more precisely elocuted your situation, I can tell
you
I am in the same boat. I've needed a new Pokey and keyboard for my
'stock' (well, +48K ram) A800, but it's 50 bucks... and I don't have
50 bucks to spare most weeks. Michigan's economy is currently
the second worst in the country right now. So, upon further reflection,

I feel your pain.

>

Depends on your definition of 'reasonably priced'. Those items, with
shipping, would be a luxury I could ill-afford. Certainly not to be
covered
by 'spare change'. I believe the phrase you're looking for is 'a few
spare
bucks'.

> so people who had cool stuff to sell would'nt think they coud get hundreds
> of dollars for it.

Market pressures and trends tend to affect prices. As a buyer, you can always
refuse to purchase an item from someone you believe is gouging you. Being
disingenous, however, will nearly always cost you in the end. Honesty is
virtue sorely lacking in today's modern world of wonders.

>Even Atari-wannabee users deserve to live in peace.

Everybody deserves to live in peace. Learn to communicate effectively,
and perhaps others won't be so hasty in misjudging you.

Not to mention my previous points about the FAQ and vendor's list
being posted regularly, but...hmmm...would two minutes of Google
hurt you? You sound like a lot of the desperate students on any of
a hundred programming forums, who wan't others to do their homework
for them. "But I don't wanna get ripped off...": then ask for people's
recommendations on reputable vendors. See above about honesty,
being disingenuous, and effective communication.

> So go back under your bridge and leave those poor people on
> comp.sys.cbm alone.

?? WTF are you talking about? I've posted little or nothing on
c.s.cbm, and what little I did yielded a great 128 + 1571,
mine for shipping (Thanks, Ed G.!!!!). How? Honesty, being
genuine, and effective communication. There was an element
of risk on both our parts, but it worked out great.

I only use one account to post to usenet, and I only
'harass' one group (c.s.sinclair). But I think at least some of
them find a post or two of mine funny. And I've found it a valuable
resource for information about just how crappy my TS1000 is :^p

I got b*tched at one time for exceeding five newgroups in a reply
header... and promptly paid more attention to the "To:" line.
The troll thing was a joke. Ha ha. Funny funny.

Once again, I apologize, and now grasp the sincerity of your inquiry.

TTFN,
Tarkin

There's a thought.

Got a spare one (older) here right now. Its one of those that the 2 white connectors plug in side by side on at PC motherboard.

I've cut off one of the dead Mega STe's power supply harnesses.

All the red (+5v) matched up (3 leads)
All the black matched up (4 leads)
A single white lead matches up

That leaves a yellow, blue, and orange on each.

My understanding is that blue on Atari P/S's is +12v, and that yellow on the PC power supply is +12v.

So I can't just color-code connect, straight across.

On my Falcon, before I hooked my CT60 up to it, I had to hook the blue lead (+12v) from the Falcons harness to the yellow on the ATX power supply. I'm assuming (dangerous!) that I have to do that here as well.

Which leaves the PC side blue and orange leads.
Which leaves the Mega STe side yellow and orange leads.

Anyone done this before and can tell me for sure, what goes where before I actually connect and attempt powering up?

Thanks much gang! :)

Mark, thats a generous offer and I sure do appreciate it. :)

Let me try getting this spare PC power supply wired up first though. If I
can get it to work, it should do until I can get a real Mega STe P/S.

Thanks again! :)

Thanks, there is a ton of useful info there. Probably a bit too advanced
for what I can do though... :(

I'm gonna try to get the spare PC power supply I have here hooked up, just
to tide me over.

Thanks again.

I've got 2, already hacked the harness off the (really!) dead one. If you guys think you can repair the other one, I'll be glad to send it to you!

> Mmmm. You might be able to codge an PC ATX power supply even.

Thats the direction I'm going to try first. Others have suggested it as well. I did wire up an ATX power supply with my Falcon, when I recased it, before I got my CT60. It wasn't that hard. I'd be happy to have this working until I can get a real Mega STe P/S again.

I'm not sure about the connections on the Mega STe's harness though. (see my other post)

Anyone have experience with this, done it before? Thanks! :)

Didn't you have this problem not to long ago about the psu giving up ?
wonder if its just overheating ? updating the drive fets for something of
more today spec could be the way to go. Low ESR caps would improve things a
great deal also. If the transformer is giving out then theres not much that
can be done. Have you any idea on whats failed ?

chris

Are we in a position to repair his PSUs? Do you still have a variac to get
110v??

I do have a 240v Mega STE back home.... And if you give me a week or two I
can come back with the pinouts from the power supply connector.

Don't worry Ron, help is on the way :) Quite impressed with how you do this
for the Atari community and I'm sure others are too. :-)

Hi Chris.

I replaced the first P/S with a used Mega STe P/S that I won in an
auction off Ebay and everything started working again, so I assumed the
first one was dead.

What it did at that time was give a white screen, or sometimes a white
screen with rows of yellow blocks on it.

It did the same thing this time... so I'm assuming the same. But I don't
really know for sure what exactly has failed...

Thanks.

I definitely would not rely on the the colors of the wire's insulators as a
guide for wiring up the machine. At best it will not work. At worst, it
will totally fry your ST.

Do some searches on Google and find out exactly what each wire is for on the ST's original power supply. Perhaps somebody in the ST group can pull out a multimeter and check each line for you. As for the AT power supply, you can use a multimeter to determine which wire corresponds to which wire on the ST.

hmmm, im sure ive seen that problem before, have you tried your old psu back
in again ? Sounds more like a ram problem, normally you don't get as far as
a white screen if the psu is bad....

Chris

Generally speaking, "reasonably priced" means as close to free as possible. The price scale pretty much starts at free and goes up from there. Items priced close to free are widely considered to be reasonably priced. Items that are priced excessively higher than free are considered unreasonably priced, and usually illicit responses such as "Are you out of your freakin' mind?" from the prospective buyer.

Well said. Although, I believe his original query was quite effectively
communicated. It was simple, clear, and direct. There was no room for
misinterpretation, but this rarely quiets the suspicious.

Its the Mega STe so I can pull the ram chips very easily - there in that
lift up compartment right in the front. I can pull them, add them back in
1 at a time and try to see if one has gone bad.

I'll do that tomorrow and report back.

Thanks for the suggestion.

You have to do 2 chips at a time. They are banked in a staggered
fashion. Slots 1 - 3 (Bank 1), Slots 0 - 2 (Bank 0). One chip won't work.

If you need ram mail me I have a box of 1meg simms lying around.

Mark

Okay, I decided to take another stab at the MFP chip that I had
attempted to do the RSVE upgrade on, and apparently, I've got it good
enough for government work, as they say.

So we're back online...

and thats the good news folks.

Just tried it, comes up so good news!

You could send your old PSU to me if the postage isn't too high, if your not in a rush for it back I will take a look and see if I can make it "Ronald Proof" ;-)

Chris

D-? Getting the country wrong is definitely worth an F. ;-)

But it's possible that he was suggesting you were giving Vancouver, British Columbia a bad name -- i.e. People might confuse people from Vancouver, USA with Vancouver, Canada. I think he might have been suggesting that Vancouver, Canada is better than Vancouver, USA, and sharing the same name, those from the USA give those from Canada a bad name.

But what do I know? I'm just happy that it's not me giving Canucks a bad name. :-p

Source record: 6268

A.N.A.L.O.G. published at least two CLIs and Antic may have had one as well... IIRC all of them were for Atari Dos 2.0 and maybe compatible with 2.5; I would have to pull the issues to check for MyDos applicability which I seriously doubt. One of these was a Dup.sys replacement and loaded into memory when 'DOS' was called in the same manner; the second was BBK and memory resident.

Compute! published what they called 'MacroDos' which was only a few hundred bytes and memory resident to appear instantly at the DOS command. It offered all options of the Dup.sys menu except Duplicate Disk and Copy/Duplicate file plus hex/dec conversion.

Hello,

Release 3 of Memo Pad, my ATASCII file viewer and converter for
Windows, is ready for downloading.

In this release I have added preferences for changing the format of the
byte offset and byte values displayed in Binary view mode.

You can download Memo Pad at
http://joyfulcoder.com/software/memopad/

Thanks,
Eric

Wow, cool.

What's this, exactly?

http://krupkaj.wz.cz/showpic.php?show=Fujiama&obr=5

Was that based on some existing Atari hardware (e.g, a modem?), or build
from scratch? (Either way, it's hella slick!)

It looks like it's a Compact Flash card reader. What's the interface? SIO?

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

>

People can, and do. Some buy diesels+conversions to reduce their cost
back to 'reasonable levels'. Ditto for hybrids. Everyone else shrugs
and bends over.

> There was no room for
> misinterpretation, but this rarely quiets the suspicious.

What are you trying say? <narrows eyes> ;^)

PUBLIC APOLOGY:
To puritan. In re-reading your posts, you said that you did, in fact,
have a job, add I now infer that that contributed to your reduced
access to 'public' computers. Which resulted in spew of written vomit
from my browser to Google, thence to this fine newsgroup. I apologize
wholeheartedly and unreservedly, for calling you jobless, and spewing
on the group.

If you're looking for individuals on particular newsgroups
to sell you particular things, your post was little terse.
Look at what happended to Bravo Sierra's post:
http://groups.google.com/group/comp.sys.atari.8bit/browse_thread/thread/ea7e406c0c5e784a

Words are cheap, as I've now proven. Use as many as you need,
or as many will fit in your browesers window, whichever is less.
/APOLOGY

From: Rick D <a8maestro@a8maestro.com>
Message-ID: <44EBB497.AD45EBDD@a8maestro.com>
Source record: 6278

Hello,

The last retro, classic, arcade, console gaming show was AGE2003, and there has been no word on another one, so I would like to get one going. I have decided to call it "GAMER". I am looking to find out how much interest there is in a show to be held in Austin, TX in July 2007. I am looking for Sponsors, Vendors, Attendees, and Help Staff. The current show info is posted at: www.a8maestro.com/sites/gamer07/gamer.htm.

Thanks for the feedback, Rick D.

7273. WTB : 1200XL keyboards and 800XL keyboards

Newsgroup: comp.sys.atari.8bit

I have a couple of 800XL's with no keyboard, anyone knows where to get spares? Also need for my two 1200XL's where a couple of keys are missing on each of them. They don't seem to be identical though!

Thanks

yeah, I have that video as an .avi file on my PC.

I also have an advertisement for "Yars Revenge" as an AVI file. It's very
amusing. "Have you played Atari today?"
Maybe that one is on "youtube" already. If not maybe I'll send it up.

OK -

I see *MANY* old atari videos are out there on YOUTUBE.

Do a search on Atari or Atari 800. Oh my god, the videos are so bad they're
a riot!

Here are a few......priceless.

I have a couple of 800XL keyboards that I could sell reasonably cheap. If
you're interested send me a note. That's my real email address in the
header.

Is "y!" yahoo? Or is it just y.com? Anyway, details are as follows:

1 Pokey chip $3.00 shipped regular mail*. Price includes postage and
handling, administrative fee, extended thirty day warranty, and the actual
Pokey chip. For sixty day warranty add $1.00.

On approved credit, you can get the Pokey chip now and not pay for one full
year. However, there is a $29.95 service fee that is due at time of
signing and other conditions may apply. Don't pay for one full year is
available only in North America excluding Hawaii, and Alaska.

* This is the cash price. There are additional charges for Visa and
Mastercard orders. See terms and conditions for additional details.

Ooops, I forgot to mention the following:

Make check or money order payable to:

Lambton Financial Credit Union
c/o Darryl Germain Acct: 5228
1295 London Road
Sarnia, Ontario
N7S 1P6

Write on the cheque or money order the following: Payment on debt. Re:
acct: 5228

Like I wrote in my previous post, I can send you at least two Atari 800XL keyboards. I have a bunch of assholes at Lambton Financial Credit Union playing God because they've discovered shitty rock radio. Anyway, if you want to buy the keyboards from me, you need to make the cheque or money order payable to Emperor Darryl Germain c/o Lambton Financial Credit Union, Sarnia, Ontario, N7S 1P6...

On the check or money order write the following: Payment on debt of account 5228. Also write, "Corruption and crime don't pay, but William Duke does!"

Yeah, money orders are just fine. Just make it payable to Lambton
Financial Credit Union and let me know when it's in the mail. I'll get
the Pokey chip on its way to you as soon as you confirm that you actually
want it.

Ah, let me guess. You found some dude in Baltimore, Maryland that was getting rid of his Atari stuff for free or next to nil. Problem was that the guy was unwilling to ship the stuff because he just wanted to get rid of it. Basically, if no one was interested in coming to pick it up, he was just gonna toss it in the trash.

Not knowing anyone in Baltimore, Maryland, you could not devise a scheme for getting your little paws on the merchandise. Quickly you ran to the computer and beckoned the aid of your fellow atarians in c.s.a.8. But no one could or would help you. Long annoyed at your constant spamming of the newsgroup, few atarians were even willing to open and read your desperate plea for help, let alone respond to it by email.

Patiently, you sat before your computer watching your email account with bated anticipation. Certain that the Atari community that had served you so well over the years, would come to your rescue and help ensure that you would not lose the coveted loot you so cunningly sought. But alas, it would not happen. The loot would be lost and Bravo Sierra Computers' attempted conquest would be foiled by those annoyed by newsgroup spam.

Let it not be forgotten, that those who live by the spam, die by the spam. How tragic. :-(

My son will be going off to college in September and will be studying computer science at the massengill institute of technology. He will be needing his own computer for these studies and I was wondering what kind of system you might be able to set him up with.

Essentially, he will be needing something for word processing as well as application development, email, web-surfing, and instant messaging with other people on and off campus.

Your 20% off all educational software and books sale has caught my attention and I would really like to save some money on this investment in my son's education and future.

Thank you, and best wishes to you and yours this holiday season.

Ahem. FYI: The guy is selling collectible home computers from the
1980's. Those are good for nostalgic collectors and for some old
computer games, but not for anything your son needs to do.
Don't be cheap and invest on your kid's education. He can get a
reasonably priced computer at any CompUSA, BestBuy or through his
college. He might get a good deal through the school for a laptop or a
desktop which is up to the school standards, and also benefit from a
student discount. You're not looking at spending much (aka: less than
$1,000, or around that price) for a good PC these days...

Best,

Simone
Who is a college prof, btw

Well, the fact that the current version wasn't what was posted wasn't my
fault this time.

I have sent new copies to the FAQ-Server at MIT several times in recent
days, but that service has been playing dead. Usually it sends an ack
email back within moments.

This has happened before, so it may come back to life again. Hopefully.
It's not clear anyone is admin'ing it at all, it may just be on autopilot.

It's really not necessary to continuously spam this newsgroup. Everyone on this group is now well aware of your business. Micheal Current lists your business in his 8-bit vendors directory and Ronald J. Hall even advertises your business on his bbs.

Instead of spamming the newsgroups all of the time, why don't you start participating in the discussions? You could even put a little "Bravo Sierra" advertisement in the signature of your posts with a link to your website. Maybe then, people will be more likely to do business with you, and they won't hate you as much.

Besides, what better way to advertise your business than to demonstrate real knowledge of your products by actually participating in the newsgroups? Just a thought...

There seems to be some problems with Windows 98SE (I know old OS, well old Ataris and old PCs). MemoPad can't find Atari.fon even though the file IS in the same folder.

Also, the recent file options don't work.

I've tried 3 different PCs. All had the same result.

I was able view files but I see an ugly, proportionally spaced font.

I do like the EOL conversion function.

Thanks for all your work. Hope there is an easy fix for Windows 98SE

- Steve Sheppard

Family Net changes IP's sometimes. It can now be reached at the URL...
fmlynet.dyndns.org

Now lately I have worked with another BBS to get me access through it's
gateway. Family Net and another BBS, the Prison Board BBS, are great because
once you get to those BBS's you can telnet out from there to places that have
changing IP Addresses.

To get to the Prison Board BBS...
216.62.20.217

Get on that BBS, hit X for the internet menu, and then T for telnet outbound.
The Fmaily BBS is one of the selections there, or you can enter in whatever URL
you want. (This is greatly helpful for those of us with the URL challenge
lantronix boxes. :))

Hello Steve,

Thanks for the report. I will look into this when I return to work. I
think there may still be a Windows 98SE box floating around there.

Can you tell me more about the recent file options not working? Do
recent files appear in the list but fail to open when selected or is
the list always "none"?

Also, were the 3 different PCs you tried all running Windows 98SE?

Thanks for your help,
Eric

Hi Eric,

All 3 PC's are running Windows 98SE.

Previously opened files do appear in the list but if I try to select
one I get a dialog box that says, "The file requested does not exist
and will be removed from the list of recent files".

- Steve Sheppard

Hey Doc, I was wondering where you had been. You seem to disappear for great periods of time and then resurface.

Have a question for ya Doc. Are bbs' your only access to the Internet? If so, and you need a dependable gateway, I'd be more than happy to give you an account on one of Linux boxes. You can use one of my machines as your gateway to the net if you want. Just let me know.

Oh, by the way, I'm in the process of learning the Python language, and my first real project is going to be to write a chat script. Sort of like the chat application that I used to operate on my Mac. Only I'll be able to add a lot more features to this one, as I'll be writing it from scratch.

Huh? People are measured inversely proportionate to their enemies? So you're saying that Ben is a great guy because he spams the newsgroups and makes enemies?

Everyone knows that it is bad netiquette to spam newsgroups. Ben has been repeatedly asked to stop spamming comp.sys.atari.8bit and other newsgroups, yet he persists with his spam. The vast majority of newsgroup participants have registered some form of protest to Ben's actions. Are you saying that Ben's actions make him a great guy?

If so, I humbly beg to differ. Ben has displayed nothing but callous disregard for the wants and desires of his fellow Atarians and for net users in general. How this could possibly be perceived as noble by third parties is beyond me. Especially, when it is these third parties that complain of Ben's constant spamming, block his messages from ever reaching their machines, register complaints with Ben's ISP, and refuse to read anything that comes from Bravo Sierra computers. These realities would make Ben the pipsqueak -- the man that continues to speak when virtually everyone refuses to hear his message.

Sure, Ben operates a business and provides a service to Atari computer owners. And he has every right to do so. But to conduct his marketing in the manner in which he has chosen is just bad business, poor judgment, and just plain irrational.

Several users of this group have gone the extra mile to help ensure that people know about Bravo Sierra computers. Dark Force BBS advertises Bravo Sierra computers -- for free I might add -- to those who telnet there. Micheal Current freely offers his time to compile directories of Atari vendors, a directory that lists Bravo Sierra as a seller of Atari gear, and makes it available to his fellow Atari users. And I've even seen the occasional Atari user recommend Bravo Sierra to persons looking to buy Atari gear.

I think there's a very valid point to be made here. The point is that there is a very definite line drawn on what is and isn't acceptable use of a newsgroup such as this. It is widely held that Ben's use of these newsgroups is not acceptable. As such, it is very clear that Ben does and continues to cross that line. I would hardly be too quick to place Ben in the "hero" category under these circumstances. And judging by the typical responses to Ben's posts -- or, indeed, lack of responses to Ben's posts -- Ben is not getting much mileage from his spam, or the enemies that he is making.

Hello Steve,

Thanks again for the feedback. A friend happen to have a 98SE box that he was working on for a coworker and was willing to test some changes for me. The problem was due to my code for checking the existence of a file. I have rewritten the code and my friend tested it and says it now works.

You can get the new release, which also contains other fixes and features, at my website.
http://joyfulcoder.com/software/memopad/

Thanks again for your help and paitence,
Eric

7318. Memo Pad Release 4

Newsgroup: comp.sys.atari.8bit
Date: 2006-08-26 23:54:41 UTC
From: eric <joyfulcoder@gmail.com>

Source record: 6175

Hello,

Release 4 of Memo Pad, my ATASCII file viewer and converter for
Windows, is ready for downloading.

In this release I have fixed two bugs that appeared on Windows 95, 98,
and 98SE. These are the failure to load the Atari font on startup and
failure to open files with the Open Recent menu. Thanks to Steve
Sheppard for reporting this problem.

In this release I have also added support for handling drag-and-drop
files as requested by Roy Dean.

There are a couple other smaller fixes and features too.

You can download Memo Pad Release 4 at
http://joyfulcoder.com/software/memopad/

Thanks,
Eric

7319. short cassettes?

Is anybody out there still using an Atari 8-bit with a cassette
recorder? If so, and if you're looking for those short little cas-
sette tapes with lengths like 5 or 10 minutes -- like what we used
to use in real life 25 years ago! (before disk drives!) -- please
send e-mail to my public mailbox. I found another use for those
things back in the '90s but no longer have that use.

I remember those. I started out with an Atari 800XL and a 1010 program recorder. I had to wait a little while to get my first Atari 1050 disk drive, because Woolco -- which doesn't even exist anymore -- was putting them on sale a couple of weeks after my parents were supposed to buy mine. I think the savings was something like $30 or $40 bucks for waiting.

So long ago... And that was back when the store employee's would let you know that something was going to be on sale soon. Ah, the good old days.

Anyway, what I really remember were those old Coleco Adam cassettes. Those drives were quite fast, and the cassettes never needed to be rewound to the beginning. I remember thinking how amazing those were. My how times have changed. ;-)

I just finished this upgrade in an XE; the second one I've done. The
first was many years ago, so I don't remember much about it. This
upgrade passes the Newell memory test program, but things still don't
appear quite right. The problem is the ramdisk. If the ramdisk gets
close to being full, MyDos 4.50 writes over the ramdisk directory.
I've tried both the XE and Newell page sequences with similar results.
Does anyone have any additional info or programs that could help me
diagnose this probelm? Thanks. -Larry

Larry,
Have you looked at this web page.
http://www.mathyvannisselroy.nl/mydos.htm
a ramdisk driver for setting D9: as ramdisk
http://www.mathyvannisselroy.nl/uspram9.ar0
here is the latest repaired ramdisk driver
http://www.mathyvannisselroy.nl/myrd2.arc

using SpartaDos version ramdisk might isolate problem and see if It is
caused by hardware or software. If both DOS's have the same ramdisk
problem. You could have a problem with the XE.

RoyE

> Larry,
> Have you looked at this web page... snip. <

Hi Roy-
Thanks for the suggestions. I'll check these out.

In comparing this 130XE with the other one previously upgraded, I find that the older one has no ramdisk issues. There are some other hardware differences, but certainly looks to be a hardware issue of some type. I'm going to disconnect a few things and see where that takes me. But the ability to use D9: as the ramdisk (with other than the CSS UltraSpeed O/S) sounds like something I'd definitely be interested in. -Larry

7326. Re: Peterson 130XE 320K Upgrade and MyDos 4.50 Ramdisk?

Got it! I checked the wiring one XE against the other and no
differences, but I gave each of the connections a "tug" test and one
popped off way too easily. Re-soldered it, and all is well with the
ramdisk. I'm still not sure how it passed the ram test, but can only
assume I had an "intermittent" connection. Thanks again. -Larry

> Was that based on some existing Atari hardware (e.g, a modem?), or build
> from scratch? (Either way, it's hella slick!)
>
> It looks like it's a Compact Flash card reader. What's the interface? SIO?

Beetle, who built it, called it the 1001. But the line of text below
the picture tells us more:

Atari 1001 - SIO2IDE2CF

It's version 3.x of SIO2IDE (see http://atariarea.histeria.pl/sio2ide/
text is in Polish, but the docs are in English). A description can be
found on my site here
http://www.mathyvannisselroy.nl/special%20stuff.htm#sio2ide

The case was made from parts of an 800XL. Apart from the SIO2IDE
interface (version 3.x, not 4.x) the only thing inside is an IDE2CF
convertor.

Greetings

Mathy

7329. My AO-Hell home page has moved

I finally have taken the plunge and set up my own web server here at the house, and am saying goodbye and good riddance to AO-Hell. I never logged into there very often, and when I did, my mailbox was full of spam numbering well up into 3 digits. Seem the REAL reason they want to control the amount of spam is to get rid of the competition. (That's my opinion and I'm sticking to it!)

SO, my new home page adress is:

http://www.lspenc13.us/Lenspencer/index.htm

You will find my HyperSpeed MIO handler there, as well as the Forem-XE Pro BBS package.

Congrats on taking the plunge. I run my own web-server too. I much prefer running my own server to using any of the free or commercial options available on the net.

I'm presently working on an Atari 8-bit software archive that I hope to take live soon. It's not much right now, but I hope to get some work done on it in the next week or so.

What are you using for your server? Myself, I'm using Apache and Debian stable (sarge) on an old SGI Indy that I picked up about a year ago. It been running quite reliably and I'm very pleased with it.

Oh, by the way, when I checked out your homebrew section, I was expecting to find something reminiscent of the old electronics/computer hacker days. I see, however, that you mean "homebrew" literally. ;-)

> suggestions?

Just wild guesses. The 800 had a ~20 some odd pin connector, really goofy IIRC. Something like a row or double row of 1" pins that went clear through the connector.

1st guess would be corrosion/galvanic reaction between the disimilar metals of the connector. *LOTS* of people have had sucess just leaving the computer on overnight to dry out/start working properly.

2nd would be pull the thing apart and clean the connector a bit. 800s are built like a tank that wasn't meant to come apart. I don't like working on them because of this. Good luck getting it back together anyway if you end up doing this.

3rd is a chip failure. The keyboard circuit uses two 4049 or 4050 hex buffers to sense the keyboard, can't remember which.

The only other IC necessary for the keyboard is the Pokey 40 pin device. If all else fails you can swap one from a working computer in and see what happens. AFAIK the Pokey never changed so even one from a 65XE or 5200 game system would work.

Don't worry about the keyboard itself. It is a solid mechanical contact type that nothing short of a hammer can make malfunction.

While you have it appart you may want to check your microprocessor board. If it has the 6502B in it vs. the latter 6502C it is fairly valuble to some of us.

Anytime I've hooked mine back up, persistant hammering on the keys
eventually brings the entire keyboard back...

Good luck.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Keyboard corrosion?

7340. Lantronix UDS 10 query...

Newsgroup: comp.sys.atari.8bit
Date: 2006-08-30 12:47:29 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2006.08.30.12.47.29.550575@charter.net>
Source record: 6197

Was hoping some of the UDS10 users from this group could help me with a couple of questions...

If I do manage to successfully upgrade the serial port on the Mega ST that runs my BBS, say to 115,200, does the UDS10 do auto-negotiation? If it does, is it automatic or do I have to adjust some setting?

I'm wondering, because I wouldn't want to do the upgrade, only to find that 8bitters with the UDS10, running at 19.2, wouldn't be able to logon to my BBS anymore.

Thanks everyone.

My friend had the same issue w/ his 800 after not using it for a *LONG* time.
Turns out one of the traces had broken in the keyboard membrane thing. It was
difficult to get at it but once we did we just used a conductive pen to fix the
trace and voila the keyboard worked again!

I'm replying from a position of ignorance; I know virtually nothing about the Lantronix UDS 10. However, I will offer what would appear, if only superficially, to be common sense.

It is my understanding that the Lantronix UDS 10 is a serial port to Ethernet gateway. As such, the speed with which the host computer communicates with the UDS 10 is irrelevant. What is important is that one UDS 10 device is able to establish a TCP connection to another UDS 10 device over ethernet.

Let me paint a picture:

```
********* ******* ******* *********
* * * * * * * *
* CPU *----------* UDS *------------* UDS *----------* CPU *
* * 115K * * Ethernet * * 19.2K * *
********* Serial ******* (Internet) ******* Serial *********
```

As you can see from the above diagram -- crappy as it is -- there is no need for the UDS 10 to do a serial negotiation with the host computer at the ethernet end of the network.

The ST computer sends and receives data to and from the UDS 10 at effective rate of 115Kbps. The UDS 10, in turn takes the data and sends it over the net at 10Mbps(?) to the remote UDS 10 device. The remote UDS 10 device sends and receives data at 10Mbps(?) and forwards it to the Atari 8-bit computer at 19.2Kbps.

Basically, the serial throughput is not relevant because the ST is not establishing a serial connection with the Atari 8-bit computer. The ST

computer establishes a serial connection _only_ with the UDS 10 device.
Likewise, the Atari 8-bit is not attempting to establish a serial
connection with ST computer -- only the UDS 10 device. The UDS 10 device
establishes a TCP connection over ethernet and forwards the sent/received
data via serial to the host machine -- Whether it be an ST, Atari 8-bit, or
toaster.

--
--
There are several things that I will never be:
* I will never be attracted to females.
* I will never enjoy the company of others.
Exactly how these realities bode for my enemy, is not of my concern.

Hi, Larry. Sorry I came in a bit too late to be of any help, but there is no ram test for extended ram unless you are running the last incarnation of a 130XE with the 64x4 ram chips and even then it will still only test the standard four XE banks and none of the added Peterson banks. This ram test shows the standard four XE banks as four extra large sized green or red blocks across the bottom of an otherwise 'normal' looking ram test screen. Oddly this same 'additional ram test code' is in the XEGS OS where it is of no use all.

If you had used the 'O' Configure option and allowed MyDOS to autodetect the size of your ramdisk and use those banks by then writing DOS files back to your boot disk, you would have been OK but with a smaller than a Peterson ramdisk. The problem came about by using 'standard' banking tables which can't take into account cold solder joints or any other hardware problems, the autodetect method will.

Using D9: as the ramdisk has been an option in MyDOS since version 4.50 first came out, you just set the ramdisk number to be drive 9 and write DOS files back to your boot disk, no special drivers/programs required. Glad you got it going, Atari ramdisk users unite!!

Larry wrote:

Running my old "gig 'n' a third thunderbird" (athlon 1.3gHz), right now
with Win98 and the latest Apache (2.2.3). I did try running with
Mandriva 2006 and its packaged version (2.0.54), but in trying to get my
Samba file access working on the local network I totall screwed up the
settings and lost all access to everything on the server (no files, no
printing, no NOTHING), so I had to fall back on the Win98 installation.
I will be working on it again later this week, but this time using my
old faithful standby SLACKWARE. I tried Mandriva because I had used
Mandrake before and liked the 9.x series, but I became comfortable with
Slackware 10.x series over the last two years, so I'm "running home to
mama", so to speak. dB^)

I had a problem of some keys not working after I took my 800 apart to
photograph it. Silver conductive paint fixed the problem.

The break was around were it plugged into the 800, which was what I
expected.

You could be asking two questions here.
No, it does not auto-negotiate on your end with your computer hooked up
via the serial port. You probably already know that you have to change
the speed on the UDS-10 to match your computer.
No, you needn't worry about the baud-rate of other computers calling
yours, because there is no such thing. They are establishing network
connections to yours...

It should be right. When I connect to your bbs from my PC, I don't use a
UDS 10 at all. It's a straight TCP connection. :-)

I don't run a SAMBA server, so I have no experience with that at all. I've pretty much gone entirely Linux at home, so I just use NFS for fileshares. I do have an old Mac running OS 9, and I've been using ftp to move files between the Mac and my Linux boxes. Not exactly the best solution, but it works. And, with the small amount of files that I actually move between the Mac and the Linux machines, it's more than adequate.

Anyway, I wish you great success with Linux. I believe that Linux will offer you a much more stable and dependable server. :-)

Ive been revisting my fav 8bit games on my new 20" imac screen with
Atari800 emulator. Wow
what a trip to play Donkey Kong, Dark Chambers, Zybex, Quasimodo,
Shamus, etc with this
beautiful monitor but for the life of me the graphics look worse then I
remember!!! I rem Ms Pac
Man looking alot closer to the arcade then it does thru this emulator?
Is the LCD and improved
resolution bringing out the blockiness? Did the old tv's just blur
the gfx enuff to make them look
better? Is it my imagination? Did anyone else notice this?

Amazingly the 2600 games Ive tried with Stella seem to look how I rem
them (minus the scanlines)
on the old VCS... I just dont get it.

I know I know, nothing is gonna be as authentic as the real thing, but
I just dont have the space to
have every system I owned over the years and the money to track down
all my fav games...

The reason is that the natural resolution of a TV is much lower than the natural resolution of a PC monitor, especially a flat screen. Which means that the graphics for the monitor has to be scaled up to get a reasonably large image. This makes edges visible that are otherwise hidden by the poor technical performance of a TV. Several emulators, for example my Atari++ include a "deblocking filter" that try to minimize this effect and to generate an image that is closer to the original without appearing to blurry.

So long,
Thomas

7356. Anyone looking to get rid of any carts?

If anyone here has any 8-bit cartridges to spare (sell, trade, whatever), I wouldn't mind seeing a list of what you have available. I'm looking to fill some of the gaps in my stash, so feel free to drop me a line and include anything you might be looking for in trade. Instructions are good but not necessary, and I'm reallly not interested in boxes at all - just carts I don't have that are in good shape.

Reverse each portion of my email address to reach me.

thanks!

How valuable?

Not sure where to look for the microprocessor. The odd board in the top
slots (not the three memory cards) doesn't have a chip that says "6502"
on it. Just some resistors, three small chips and these three larger ones:

A401:
AMI 8227MAA
C1 5299-01
Atari Philippines

A402:
Atari
C012399B
185 c 1982
8235

A403:
8301
C45029
C015199-03

Unless it is the POKEY...

IMHO: Go ahead and scout a replacement keyboad but it could also be the
POKEY.

Probably $50 or $60 for the populated board and maybe a trade for a
6502C board included.

The 6502B can be directly replaced with a 65C02. You can also put a
65802 in but I have never been able to find one of those. You get an
expanded instruction set and it can be used with MAC/65 which accepts
the 65C02 instruction set.

From the dates on the chips, as late as 1982, looks like a newer model.

Though I am not familiar with all the Atari DOS's it seems that most used a letter based menu system as their main interface. Did anyone ever creat a graphical interface for one of the Atari DOS's? It would seem to be, if not easy, doable with the Atari's graphics and redefinable character set and using a Joystick instead of a mouse. I am not talking about a full blown windows like clone, but somethign similiar to the interfaces that were available MSDOS that allowed you to see drive listsing graphically and drag / drop files from one drive to another.

There is a whole boatload of them. I distinctly recall there being at least one commercial GUI for the Atari 8-bit line of computers. I don't recall the name of it, but I believe it was published by Artisan Software or something like that. I think it was the same people who were responsible for the failed 'Atari Revolution" some years ago. Although, don't quote me on that.

There were several public domain and shareware GUIs produced for the old 8-bit Atari computers as well. Try searching some of the many Atari 8-bit software archives. You're sure to turn up at least a few.

I don't believe I have any cartridges left, other than a few very common
ones. However, I think I have some old Atari software documentation
kicking around. I would imagine that they're all probably in pretty rough
shape, but if anybody is looking for stuff to scan or photocopy, I guess
they'd be good enough for that.

there was Diamond OS, something called AT TOS or something like that,
there is a newer
one too called TSR or or TRS it's from POland and is written in Turbo
Basic. There was
also a port of Contiki for the 8bit. Im sure there are others,
personally I dont see much
need for them on the 8bit.

I'm the same way. After being dragged kicking and screaming into the UI
world in the early/mid 90s, a nice command line DOS is just right for me.

Source record: 6127

This same question came up not long ago, and I mentioned then about Screen Aided Management (SAM) from PPP Germany. I still have the rights to distribute the English version of this. It's an 80-col GUI (done in software) and is operated by either a joystick or ST mouse. It comes with all the usual stuff, but also has a spreadsheet, word processor, and desktop publisher. Because there appeared to be interest last time around, I produced a new issue of it with the manuals on a CD to reduce the cost. I only sold ONE copy though. It's also available as part of our Atari CD-ROM software collection, along with all the other PPP products (including the QUICK programming language), and loads of other stuff. This CD can cost as little as US$6 including shipping. Payments are made in US$ using PayPal (also in UK Pounds for UK buyers). Info at: http://www.dgs.clara.net

If anybody wants the Atari disk-based with manuals on CD-ROM version, then please email me (dgs@clara.net) because they aren't available on the website.

7373. Atari Revolution?

Newsgroup: comp.sys.atari.8bit
Date: 2006-09-03 23:36:47 UTC
From: AlbaClause <you@cogeco.ca>
Message-ID: <oBJKg.29336$sS1.2788@read1.cgocable.net>
Source record: 6129

Somebody posted a message about GUIs for the Atari 8-bit, and it reminded me of the old Atari Revolution. I've been thinking about it for the last few minutes, and I was wondering why it failed.

On the surface, you would have expected it to have some success. I mean, there are millions of Atari computer users worldwide. I would guess that there were probably thousands of loyal Atari computer fanatics at the time. Especially in Europe, but there were some real fanatics in North America as well. So why didn't this movement ever get off the ground?

The 'Revolution' was lead by a seemingly successful business person -- a software publisher -- and was in support of a corporation that was listed in Fortune's 500 directory of the largest corporations. Clearly, there was some money invested in the campaign, and lord knows there was no shortage of people that were just fanatical about evangelizing Atari computers. So why did it fail?

Was it that people just don't get too wrapped up in wasting their time marketing corporations on their own time and dime? Was it that corporate affairs aren't of great concern for the average Joe? Why did it fail? Why did Atari Corporation and the grassroots "Revolution" to save Atari Corporation fail?

Whatever the case may be, one thing is very clear and certain. People don't get overly worked up about a corporation that is failing. On the contrary, it would appear that people are more apt to pool their energy and resources to bring down a corporation, than they are to save one. I'm thinking specifically of WalMart in this respect. There's no denying that people have rallied in opposition of WalMart. I've yet, however, to see people rally in support of WalMart.

I just think it's bizarre that such an effort would fail so miserably. Perhaps the writing was just on the wall. Atari's computer manufacturing days were over -- or, minimally, drawing to a close, and there was nothing that anyone could do about it.

I suppose you sometimes have to swallow the bitter pill that life and reality feed you. For thousands of loyal Atari enthusiasts, that bitter pill was the cessation of Atari computer production. But most remarkably, the thing that really drives the point home for me, was that those loyal Atari enthusiasts just moved on as though nothing had happened. The world hadn't ended, and there were still lots of great computers being manufactured in places like Germany.

The real lesson learned in all of this, is that people really just don't care. A company comes and goes as the seasons of the year pass by --

they're praised or condemned while they're around, and hardly missed when they're gone.

Gee, I wonder if the Blackburn Revolution will meet any success? With history as a guide, the odds are certainly against them. And they haven't had a personality that anyone has cared about since they fired Gary Connors. Apparently revolutions only succeed when they're orchestrated by the wee folks. When corporations launch revolutions, it's generally viewed as a hostile takeover, and very few people want any part of it.

In the SGI community, the hobbyists have pretty much given up on them to. There was a protracted period of time where they would complain about all of the mistakes and blunders that the management of Silicon Graphics had made, but the resentment has pretty much waned. Once again, the people are seeing that the writing is on the wall and that there is no saving the once mighty juggernaught.

It's truly a shame that companies that have managed to become so much a part of our life are reduced to meer memories, but the reality is all too real. Things change. People change. And time marches on. No can stop fate from playing its hand, and no amount of mercy can grant salvation to those who seem bent and determined to bluff their way to the end.

I saluted you, in your final days, Atari. I standby you, SGI, and pray that you'll emerge from your coma. Blackburn, I've lost faith in you. I've instructed the doctors to pull the plug. May you find understanding in Hell!

I started going to the Dayton Computerfest about 1985, and went almost every year until around 2000. But (IMO) online computer sales and auctions have killed off most of the business that the vendors traveling the computer show circuit once enjoyed. Check the announcement at: http://www.dma.org/
For maybe 8-10 years, DMA also had a spring computerfest, and I could see it wither as the years went on. Then they dropped it. Other computer shows that once were pervasive have suffered the same fate. Just as the PC's crowded out the other platforms, the internet sales have crowded out the shows. It is regrettable, but evidently there were lots of people like me -- why travel to a show, fight the crowds, and have an inferior selection/price as compared to what is available as I surf the net? And if you are a seller, why not set up a site on the internet instead of loading up equipment, driving, setting up, etc.
-Larry

please check your private mail. Sorry, but the file server of the math
department of the TU Berlin was down this weekend, it should be up and
running now again. Unfortunately, this happens from time to time.

Anyhow, I'm working on a new release anyhow currently that addresses
some issues of the AMD64 port, it should be ready within a few days
(mainly, documentation issues, a bug in the mathpack patch, and quite
some bugs in varargs handling.)

So long,
Thomas

I'm not sure either, but it reminds me of something Don Thomas (then Atari employee) did for awhile. It was a series of articles endorsing Atari, pushing Atari, etc, etc,... Kind of like an underground movement.

It was very good reading, I enjoyed it anyways...

I just googled, found this:

http://www.ataritimes.com/features/nl_news.html

"While seeking employment anywhere I could, I dedicated time and energies into the Atari Revolution... a grass roots movement dedicated to foster word-of-mouth for Atari's fine line of products."

Greetings everyone!

Here are the lucky, the few, the proud winners of this months prizes at The DarkForce! BBS:

August 2006
1. ST Magazine - Mega/STe wins the free 3 mag. subscription

Congratulations to our winner!

Also, here is next months prize:

September 2006
1. ST Magazine - some lucky Atari caller will win a free 3 mag. subscription.

Good luck to all! :-)

7381. Atari 130XE cartridge slot adapter?

Newsgroup: comp.sys.atari.8bit
Date: 2006-09-05 15:16:47 UTC
From: "JohnH." <john@jrcc.net>
Message-ID: <1157469407.399614.257510@m73g2000cwd.googlegroups.com>
Source record: 6138

Hi, I'm using a 130XE. Given the ergonomics of my desktop the
location of the cartridge slot is a little bothersome. I much prefer
the 800XL approach of putting the cartridge slot on top. Has anyone
ever seen an elbow adapter or some other type of widget that allows you
to change the cartridge on a 130XE w/o having to fish around behind the
computer. Would it be difficult to make something like that?

Thanks,
John

That is a copy of the MIO manual from ICD. The price and listings are
from the way back when ICD was still around and prod MIO boards, so
none of that is accurate now. You should be able to find Spartados X
someplace if not new try Ebay.

John,

You can put Spartados X on a 1mbit Flash Cartridge, though there is
no pass-thru connector like there is on a real SDX cart.

There's an adapter does what you want. It is a ECI (I think
that's what the 130XE rear ports are called) to PBI edge
connector for use with Black Box or MIO. It has one or
two cart slots on the top, it plugs into the two ECI ports
and has rubber feety that hold it up off the table.
Who/Where to get one? I don't know. Nobody has
the MIO any more, uhm, dunno where.

I read someplace (maybe Atariage) that MIO is going back in producion
for a limited run so maybve the 130xe to 800xl adapter will emerge
again.

If you want I can log on and test it.

Not sure if it does the autonegotiation or not.

Well, from some of the other replies I got, it *should*.

If I ever get it working, I'll contact you and let you
test it with me. Thanks!

Hi, My first focus is having the show. MY second focus is atari 8bit. I
will have 8 bit stuff, and
see what 8 bit gaming rings can be set up. Third focus is all other atari,
but ultimately
the content is determined by those there otherwise it won't happen.

Thanks,
Rick D.

There are a few GUI around. The only one I played with was Diamond GOS,
slow and limited to atari dos 2.0/2.5. But, a different GOS and GOE
are 2 I may still have. Nothing really stuck. Mostly because they were
slow and took to much ram. And
you needed apps to make them useable. I also see the post of SAM from PPP,
not familiar with that one.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Yes, there have been new limited runs of both products, although I
believe they are all taken. Maybe there'll be a 2nd run.

I have a 130xe which has a top cart slot, and also twin sio ports on the rear, piggybacked. I am sure it was home made , not by me, but if anyone would like to contact me direct, I will mail any pics they want direct to them. It looks like it was done using parts from an 800xl !

I /still/ have the following Atari 8-bit stuff available, for free.
A bunch of it was stuff I didn't know I had, but was being kept in storage
by my father.

The condition: you have to arrange to pick it up from me, or have me
deliver it to you, in or near Mountain View, California
(I work in Menlo Park) which is between San Francisco and San Jose.

Please contact me directly via e-mail if you'd like any or all of this.
First-come, first-served!

* Atari CX85 numeric keypad (probably works fine; haven't tested)

* Accuball trackball controller (probably works fine; I just cleaned the ball)

* Atari SX212 1200bps modem (has both Atari SIO and 25pin PC serial ports)
(I can't find a power adapter for it!)

* Atari 1200XL mother board (looks like it was left outdoors :^(poor guy!
Did not power up when I plugged it in. Either dead, or at the least needs
some love and care. May be good for parts. Not upgraded; includes
RF shield. Labelled: "DA 243 REV. A" on a sticker near the keyboard plug.)

[Remember: This is just the mother board; no case, no keyboard.
I have some power supplies that I think are appropriate for it.]

Thanks again!

Source record: 6067

---------- Forwarded message ----------
Date: Wed, 06 Sep 2006 11:41:12 -0700
From: Sellam Ismail <sellam(at)vintagetech.com>
Subject: Vintage Computer Festival 9.0

TEN YEARS AGO, a typical home
computer system might have
been a box with an Intel
processor inside running a
Microsoft operating system.
And there were a few Macs.

Today, a typical home computer
system might be a box with an
Intel processor inside running
a Microsoft operating system.
And there are a few Macs.

What a crock.

Give me them old timey computers, damn it!

VINTAGE COMPUTER FESTIVAL 9.0
November 4-5, 2006
Computer History Museum
Mountain View, California
http://www.vintage.org/2006/main/

Make an entry in your PDA! It is time once again to shun your modern
day computing monstrosity and spend a weekend with its venerable
ancestors at the ninth annual Vintage Computer Festival. VCF 9.0
takes place on the weekend of November 4-5 at the Computer History
Museum in Mountain View, California.

Highlights of this VCF event include:

* A celebration of the 30th anniversary of Apple Computer

Apple didn't want to do it, so we will! Hosted by Bruce Damer of
the DigiBarn, this gala event will feature a bevy of early Apple
founders, including the big man himself, Woz!

* A reprise of the original Sol-20 prototype

Nine years ago, at the very first Vintage Computer Festival, Lee
Felsenstein and Bob Marsh reunited after many years to jointly
present the original prototype of the Sol-20, which hadn't been seen
in public for over 20 years. This year, Lee and a gaggle of

Processor Technology alumni will bring back the venerable grand-daddy of all Sol-20s to celebrate this ground-breaking personal computer.

By the way, coverage of the first Sol-20 reunion can be found here:

http://www.vintage.org/vcf98/vcfpics3.htm

* The first Vintage Computer Film Festival

That's right, a film festival dedicated to movies and documentaries that have a vintage computing theme! At the past two VCF events we've screened Jason Scott's "BBS Documentary" and Greg Maletic's "The Future of Pinball", as well as "Walking Rainbow", a remembrance of Homebrew Computer Club co-founder Fred Moore. We've decided to take these screenings a step further and turn them into a full-blown film festival to coincide with the VCF. Film buffs will definitely want to take note and stay tuned for further announcements.

* Hands-on Build-It-Yourself workshops

The VCF is proud to debut the first Build-It-Yourself workshops, featuring the hottest retro-computing and retro-gaming kits out there, including Andre' LaMothe's XGameStation Pico Edition and Bob Armstrong's Cosmac ELF. More details to come soon.

* Speakers, Exhibits, and the VCF Marketplace

Of course, no VCF would be complete without a terrific line-up of amazing and interesting speakers. This year's bunch includes Paul Saffo of the Institute for the Future, microcomputer historian C. Murray McCullough, Archaeologist and VCF Fellow Christine Finn, and more to come with new speakers being added weekly.

We're also receiving submissions for some phenomenal and exciting exhibits. Perhaps you've got a computer you'd like to bring along to show to the world? Sign up to be an exhibitor! Go here:

http://www.vintage.org/2006/main/exhibit.php

And of course we have the ever-fabulous VCF Marketplace featuring hard-to-find items that will start your adrenaline pumping. Bring cash. Lots of cash.

* more, More, MORE!

Another fantastic celebration is in the works, and I don't think we're done just yet, so watch for upcoming announcements to litter your inbox and check the website for more exciting details to be revealed in the coming hours, days and weeks!

Best regards,

Sellam Ismail
Producer

Vintage Computer Festival
http://www.vintage.org/

P.S. The Macs were then, and are now, much cooler than the PCs ;)

Hello Greg,

Memo Pad currently does not allow editing. The only change you can
make is changing the end-of-line character(s). Text editing is planned
for a future release. Support for "Break" movies is not.

Thank you,
Eric

Oh - ok. I thought it may have been one of those crazy laws like you
can use certain programs that have LZW compression in them outside of
the US because the compression could be used for sending secret
information etc.

Yeah, that's how I used to be. I used to be a quiet person that just kept to myself and didn't bother anyone. But then I got caught in all the crap that people think is so great and so much fun. Now I just don't care anymore. Now I say what I think and I really don't care if I offend people. After years of tolerating the crap from other people, I started dishing it back.

As I sit here right now and type this, I have adopted a whole new outlook on life. I no longer value the contributions made by anybody. I don't care what people think of me, cuz I don't believe it possible that anyone could view me in as bad a light as I view them.

I used to really like Atari. Heck, throughout high school I was more interested in Atari than my friends were in girls. That says a lot. But anyway, I don't care if people want to disregard my ramblings and add my name to killfiles... I really don't give a shit! After 29 years of having to listen to your crap, you can learn to adapt to listening to my crap... Just as you forced me to do!!!

So if you wanna leave... Good riddance!

Hi All,

What are the best joysticks and paddles that I can buy now?

I've bought a several Atari joysticks off of eBay. None of which seemed to have aged particularly well. I've had the same problem with paddles. I bought a set of paddles "New in box." I believe they were new and never used, but they still seemd to not work well. I'd like to get a couple of really nice joysticks and paddles.

Thanks,
John

I may hear some flack from the purists in the group :), but I would
actually recommend getting yourself one of the Flashback 2 units. No, not
for the games - for the joysticks. I have a couple NOS original joysticks
and Flashback 2 joysticks, and the Flashback 2 sticks seem to be made
pretty well. They're also _almost_ true to form with the old ones, about
1/4" shorter each length and width and slightly different styling top to
bottom.

Also, the Flashback 2 system itself isn't half bad, but the sticks alone
are just about worth the price.

I still think the Wico Boss is awesome. I also like the ergonomic version
of that same joystick.

I'm pretty sure they are not made anymore but if you can find one from
someone reputable, like Best Electronics (who also have other nice
joystick models), B&C Computervision, or Bravo Sierra computers..

HTHs, and good luck.

Personally, I think the stick is to long for certain games. I run much
faster in Decathlon with a Kempston Competition Pro 5000 than I managed with
the Boss. Very responsive and fast stick.

Get one of the Wico Command Control joysticks. Unlike the Boss, these have steel handles like the units made for Arcade consoles. These joysticks are indestructable and easy to use. I have one I got in 1983 that works as well now as when it was new. I see a few of them on ebay such as the one below...

http://cgi.ebay.com/IOB-WICO-COMMAND-CONTROL-BAT-HANDLE-JOYSTICK-ATARI-VIC_W0QQitemZ140027527998QQihZ004QQcategoryZ41009QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

I don't think I ever needed paddles. Not many programs use them.
Maybe Pong for the 8-bit.
Joysticks, I've had a few. By far my favorites are 'Slick Stick'
sticks, don't remember the company. They are small, especially
short 'throw' from one extreme to the other. They are black
small base size for fitting in the palm nicely, have an orange
ball on the end of the stick part.
Part of the OP's problem may be not the paddles and sticks,
but the port. Repeated plug/unplug is about the only way I
can think to clean the port pins and sockets of the stick.

On Tue, 5 Sep 2006 at 10:31 -0500, Docrotcod scribbled:
->Sorry but I won't be scanning the newsgroups any longer. The ran-
->dom advertisements of Bravo Sierra and things of that nature have
->really taken the interest out of the newgroups for me.

With all due respect (an old-fashioned phrase of politeness which is totally out of place in the Internet age, especially on the Use-net!), this is baloney. Somebody else posts public messages, and that offends you!? Moreover, the postings are from the last Atari dealer in North America still participating on this newsgroup, and that offends you?

(Don't forget that you whiners chased all the other dealers in North America off this newsgroup. Several years ago the owner of Video 61 posted here that the others were afraid to post anymore because of the flak from you guys. Remember that?)

To paraphrase what another poster said here about a month ago.... You see the poster's name (with the convenient initials B.S.) in the message list, you see the subject line giving at least a clue to what the posting's about, you consider the posting to be B.S. -- AND somehow you have a big problem in simply skipping that posting???

As Rod Serling used to say on "Twilight Zone".... I present the following for your consideration: Somehow we seem to have slipped into the Bizarro Atari Universe. All of Ben's satisfied customers and other Atarians of good-will regularly skip over his postings and don't read them! Meanwhile, all his enemies dote on his postings and are somehow trapped into reading them!

It's all really too funny. But there's more....

->... and things of that nature have really taken the interest out
->of the newgroups for me.

"Things" of what nature? <grin>

Listen, you wanna talk about problems on newsgroups? I'll bet you don't even look at any other Usenet NGs. I do. I follow 20 to 25 NGs regularly plus some others on an occasional basis, and to do that I have to be extremely selective in reading. I know how to skip 99.99% of all the postings. But let's talk about problems. You oughta see the problems that have existed or are still happening on other NGs. (I'm not gonna mention specifics because I don't wanna encourage copycats.) In comparison to the antics going on elsewhere, this NG is the epitome of virtue and a paragon of seriousness and good technical information.

->I will see you all on Atari chat nights or wherever.
->Thomas

Yeah, sure, pal. In the Bizarro Atari Universe, or wherever.

Speaking of arcade joysticks, the mechanisms are readily available
(thanks to MAME console DIY projects, I think).

Anyone build their own joystick or console for their Atari 8-bitter?
Just curious.

My old Newbridge Design (or was it Newton Design) joystick also has
held up well, though I wouldn't call it indestructable. Bad ergonomics
and terrible button but the stick is the most arcade-like I've used,
because it is an arcade stick having short steel shaft with a ball
knob. It's a great frogger stick at least

The Competiton Pro joysticks are very good, good stick and very good
buttons, left and righ handed.

I don't kow of any new joysticks.

I would like to have/build some kind of combination Atari/MAME stick,
but not a console.

Sorry, guess I went off topic.

->Has anyone ever seen an elbow adapter or some other type of widget
->that allows you to change the cartridge on a 130XE w/o having to
->fish around behind the computer.

I feel sure that several devices on related themes were available in past years when there was a bigger market for Atari 8-bits. And I've seen various such mods at Atari and other computer shows over the years. Perhaps the people in the Chicago Atari group could help you. Here's a quote of part of what I wrote about their display at the Vintage Computer Festival in West Lafayette, Indiana, two months ago:

->Rory McMahon of the Chicago Atari club had ... Another cool mod
->(running an Atari 8-bit cartridge) ... what looked like a 130XE
->keyboard and motherboard in a 130XE case, hooked to a flash memory
->card, and with a small color LCD screen attached to the case. ...
->The website for the Chicago group is: www.scatarians.org.

Is there anything in the FAQ file about this?

wow all the way to 92? It makes me wonder if any bbs's from the 80's
the real old school ones are still operating to this day? Also do any
bbs's allow direct dial up connection anymore?

Im not sure what possible use a bbs would be for these days aside from
nostalgia, but it's kind of cool people are still tinkering witht he
old software.

The POKEY is on the main board/motherboard, toward the
left and rear. It is a 40 pin chip (LSI). There are only a few
40 pin ones there. It has the number CO12294 on it, probably.
Hope I'm right.

We've been going since the early 90's as well, although we did take a 5
year hiatus from about 1999/2000 to 2005... (see sig). :)

They definately had a short shelf life.

FWIW: I still have the book "Free Software for your Atari" around here somewhere. Would have been published 1983 and bought by me around 1984 or 1985.

Even at the time I believe at least 80% of the BBS's listed were out of the game. It did hook me up with a couple of local BBS's like Compucat and Itsy Bitsy as well as a couple local user groups.

BBS's, while a valuble resource, were frustrating to use. I remember being limited to 30 minutes on Itsy Bitsy. At 300 BAUD *IF* I tried to download an 8k file, it would log me out at 7.8k when my time limit was exceeded.

Using the message bases on a busy board was also an exercise in frustration. I mean it may take you 10-20 minutes to read the message base and if you replied to anything you were frequently disconnected if you ran overtime while attempting to reply.

Things got better when I upgraded to an Avantex<?> 1200 BAUD modem and shortly after to a Supra 2400 BAUD. I still had problems with time limits and busy signals.

IMO: About the only local BBS worth running these days would be a Waffle type board. It was Mike Sherwood at a BAAUG meeting that convinced me to give his Stainless Steel board a try for my first taste of the internet. I had used Fidonet and CI$ prior to that of course. I think he said it cost him $600 or $700 a month to run at the time, internet access still being expensive. There were quite a few Waffle boards back then that

would subscribe to a newsgroup and if you asked nicely would add one like comp.sys.atari.8bit.

Even with Waffle you still had problems with time limits and getting files by sending an email to an FTP server was an art in itself.

Sorry for the confusion but I meant the "2nd phone line/local call thing". Of course there are sites on the web that are great.

What Waffle did was download usenet newsgroups and let people w/o an ISP participate in the discussions. The software would toss your posts onto the usenet for you. Kind of like a super fidonet carried out over the internet. For that matter, I thought fidonet allowed you to do the same now???

I seem to recall one of the internet landmarks was when the traffic on the usenet exceeded what could be downloaded in 24 hours with a 2400 BAUD modem.

When Portal offered unlimited ISP for ~$25 I bailed out on the Waffle boards since by then I was proably using them 30+ hours a month.

7448. PC Joystick to Atari?

Newsgroup: comp.sys.atari.8bit
Date: 2006-09-11 12:20:53 UTC
From: "JohnH." <john@jrcc.net>

I thought it was used when you controlled squares of your color, and you wanted to hold on to them longer, by reversing the flow. Reversing the flow of time also reversed the color change, keeping your players at their strongest. In addition, you could catch the other teams players off-guard so that they wound up on squares opposite their teams color (and at their most vulnerable).

This is all from memory though, as I have the original Archon but I don't have Archon 2 anymore.

HTHs. :)

I run a full-blown "old-style" BBS on original Atari hardware and
software. It was originally modem only, but I have it available by telnet
now. Aside from switching from the modem to a serial port to LAN
converter (Lantronix UDS10), its running on nearly the exact same setup I
had in the 90's (only diff. is that I had 10 CDs online in the 90's and
I've only got 3 CDs online now).

You simply telnet to darkforce-bbs.dyndns.org

Thanks...

PS I only offered up the website URL in case you wanted to see screenshots
of what I'm doing without actually telnetting into the BBS itself and
looking around...

My favorite joystick is the Suncom TAC-2. I have two of these joysticks, one that I've used since 1984 or so, and a second that I bought off ebay a few years ago. They're very solid, with a metal joystick shaft, and very predictable action. I have trouble playing Pacman games with any other controller. Here's a link to a wikipedia article: http://en.wikipedia.org/wiki/TAC-2

I don't think so, John. PC joystick is analog, whereas A8 is digital.

What Russ said. But you can use a PC J/S as a paddle input. Les
Brilliant<sp?> did it in an old ANALOG. He gave a great description of
the working of the Paddle inputs and values of the replacement caps to
put in the IBM style J/S.

There just isn't a lot of software that uses Paddles of course.

Source record: 5964

Hi Jack-

I've had a Backpack, and it must be connected on a bi-directional
parallel port -- that lets out the A8. Now ***maybe*** if you wrote
whole new driver(s), but still extremely doubtful.

Have not had an Iomega Zip parallel, but I have to believe the same
thing applies.

The closest that you could come with a Zip drive or Backpack is to hook
it up to a PC and access it through APE's PC Mirror. This does work,
as I've done it with Floppies, USB and IDE Zip Drives, and of course,
CD-Roms. Which is just another example of how extremely useful APE is!

I'd never seen any of these commercials before. Makes me wonder just how hard Atari's marketing department worked at actually airing these things.

I guess I'm just disgusted with Atari's piss poor management from the beginning. It was a fine computer with a piss poor management structure to back it up. No offense to Nolen, who pretty much left Atari before the so called Golden Years.

My point was that people will antagonize you either to get a reaction or to move you along. So everybody has some choices to make. They can dish it back, they can ignore it, or they can do as the trolls want you to do: move along.

Obviously, Docrotcod chose the third of the choices.

Personally, I tend to ignore most of the threads that I have no interest in. Sometimes I will get defensive and dish it back. Other times I just retreat for a short period and return when I'm clearer of mind.

But yeah, the good riddance part was just a silly little play on the idea that you're free to leave, and that the newsgroup will continue pretty much business as usual. And, of course, by leaving, you're just giving the offensive party the satisfaction of having gotten to you.

Just my two cents.

Sid Pacman doesn't purport to be the Usenet Chief. Actually, if you look
at his signature, you might expect that he is against censorship. Which
is a good and noble position for one in a free society to take.

>
> If BS can show me a decret, what makes it the allover-protector of
> older Software. Well, then....
>

I'm assuming that you meant "decree" and not "decret". Regardless, the
point probably is that the usenet is free and open to everyone. Everyone
is entitled to make a contribution here, whether it be objectionable by the
majority or not.

B.S. is certainly entitled to post in this newsgroup, just as you and I are,
and our only real recourse in dealing with unwanted posts is to filter or
ignore... or occasionally lash out. :yeah:

And, for the record, I don't care if people filter my ramblings. I don't
post here very often and I try not to post in threads where I cannot be
somewhat helpful or insightful. It's a free country! Speak up!

I seem to recall the tapes of the Coleco Adam being random access. I know that the 8-track tape just keeps moving in a constant loop, and the head moves back and forth across the tracks. If I'm not mistaken, the tapes in the Adam would rapidly rewind and fast forward to randomly seek the data on the tape. It blew my mind the first time I saw them in action.

If I'm not mistaken, they had some rather ill-conceived plots to have
Hollywood use Atari computers exclusively as props in television shows and
movies. The catch was that the actors and actresses were actually supposed
to use them in an episode and somehow have the episode revolve around the
Atari computer. I think shows like Roseanne were targetted by this idea
-- obviously, it never happened.

I think ones of Atari's biggest problem was sticking with the 800/400
style computer when building the 800XL / 600XL. They should have held
out with the 1200xl and then gone straight to a better machine similiar
to the 130xe. This would have left them in a better position feature
wise than the other 8bits. Going to the 800xl / 600xl was just
rehashing the 800/400 in a new case with a few extras.

What Rick said...but doesn't it have two paddle inputs on each port? If
so, you could write a joystick driver for your own programs that would
substitute reading the analog paddle #'s for the digital joy stick #'s.

I've actualy been waiting for someone (maybe even me) to get aroud to
trying that for years.

A few extras? The XL line was a huge improvement over the 400 and 800
computers. Better graphics, more memory (800XL), builtin Basic, smaller
footprint, and the addition of the PBI. Of course, the XL line lost two
of the four joystick ports that the 400/800 had, one of the cartridge ports
that the 800 had, and the ability to upgrade memory with a simple plug-in
module. Overall, I can't imagine why anyone would choose the 800 over the

800XL.

The 1200XL was kind of the black sheep of the XL family. It had a few little extras that the other XL machines didn't have, like programmable LEDs on the keyboard console, but offered nothing of any real significance over the 800XL. So I'd have to agree with you on the 1200XL being a waste of time and resources.

The XE machines were a joke in my opinion. Atari scrapped/redesigned the Parallel Bus Interface that so many relied on for things like the BlackBox or MIO, and housed the whole thing in an ST style case that looked and felt really cheap. Barring the membrane keyboard of the 400, the keyboards on the XE were by far the worst I have ever used in my entire life. I think Atari would have been better off by keeping the overall aesthetic design of the XL series and just modernizing a bit with some different colours, etcetera. But this is just subjective opinion.

Pretty simple? It would be too simple. You'll need a PC board with a card edge connector that will fit into the cartridge slot of the 130XE. For the actual cartridge slot on the PC board (the slot to plug your cartridges into) I'd be looking at stealing from a broken XL class machine. They have those little plastic cartridge housing gizmos that just pop off the board. Also, a little desoldering, and you have yourself a cartridge slot to transplant to your homebuilt device.

For everything else, you can either etch your own traces, use wirewrap, or just solder little wires from point to point. I couldn't imagine an easier Atari 8-bit mod project existing.

Spam is a way of life on the network (and real life if you open your
eyes) now. If you cant learn to automatically ignore what you dont
like, then you are pretty much screwed.

Aside from that, i really dont think that an occasional non offensive ad
from one of the last 8-bit dealers out there is a bad thing, and i bet
others agree..

But if you dont want to be part of things here anymore for *any* reason,
that is your choice.... seeeya.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

```

> computers. Better graphics

Actually the graphics are the same, same exact ANTIC and GTIA that is.
What they did was add the set up routines to the OS so you didn't have
to write your own display list. It was more easy access for BASIC
programmers then anything else.

The actual video output took a beating. That's why there are so many
'Clearpic' type mods.

>, more memory (800XL),

True but it wasn't a huge improvement. Computer years are something like
dog years. Original 800 came with only 8k for a little while but was
expandable to 48k. To have a computer come out 5 years later with 64k
with the extra 16k nearly impossible to use by your average consumer was
not exactly revolutionary. Most power users had already upgraded their
800s with Mosaic, Byrd, Magna, or Axlon, type expansions so an 800XL or
600XL was a step backwards.

> builtin Basic, smaller
> footprint, and the addition of the PBI.

All very nice. I remember when San Jose Camera had 1200XLs on sale for
$249 but I passed on them because they wanted $50 for a BASIC cart.

They also effectively lost 4 paddle inputs.

You should look at the converse of your statement: I can't imagine why
anyone would choose the 800XL over the 800.

Which is the key to why Atari, Commodore and Apple went down and IBM/MS
DOS style clones won the day.

Let's say you are an 800 power user. You have a Magna 256k memory
expansion, Bit 3 80 column display, and Corvus HD hooked up to the J/S
ports and a Happy 810 or two, and modified OS.

Why would you want to spend ~$100 on an 800XL and another $200 on a
1050? Not only is it a backwards step in hardware, some of your software
won't run and the built in BASIC rev B is worse then your rev A cart?
For that matter, the only things you have that will work with the new
computer are your CARTs and the 810s.

The IBM clones carried the day because for example you could upgrade to
an AT and still use your Herc card and monitor.

A unhacked 1200XL is a disaster but a hacked one is a thing of beauty. I
see a stock 1200XL as a parts kit. Kits are dead as a percentage of the
market of course.

Yes *BUT* they finally gave you memory expansion that was useful and the
video output of the XE is probably the best of all 8 bits.

Actually the big thing that IBM had going for them, and Apple also were
the slots for future expansion. Atari, Commodore, Radio Shack, TI and
others all made the mistake of not allowing 3rd party companies to make
low cost expansions for the computers and instead had to make
semi-intelligent products that plugged into the machines.

If atari had stuck with the 1200xl, let developers write some software
for it for a year or so and then released the "2400xl" based on the
1200xl with many of the specs of the 130xe (128k memory for example)
and put in a logical expansion possibility (expansion slots), a
standard parrallel and serial connector and internal disk drive they
could have had a machine that would have beat the commodore 64 and
probably the 128. The machine would have been professional enough for
business and could have competted with apple in the schools.

The lack of Basic (or other programming language) is not a hinderance
if you are aiming for a larger market.

IMO: You give to much credit to Apple management. You have to remember
the expansion buss was a Woz thing and as soon as they could get
engineers other then Woz, they went to a closed system, the Mac.

The one system that did sneak through, Apple IIGS, was intentionally
crippled so as to not compete with the Mac.

Schools yes but I was doing the Fortune 500 thing at the time and I
would say Atari *NEVER* had a chance in the business world. An engineer
friend and I put in a recommendation for an Apple II ~1979 with a couple
of disk drives and printer for general lab work like data reduction,
graphing, data base. Top to bottom and I do mean that, the entire IT
staff crapped all over us. It actually went all the way to a meeting
with corporate VPs where my friend and I were trashed as weak and stupid
know nothings. Ended up with a crippled program in Fortran on a VAX that
used a Daisy Wheel printer to do one type of graph and store results.

It wasn't until the IBM PC came out in ~1982 that we got a couple
computers in the building. Even then a couple of us would bring our own
computers into work because the PCs were always busy. We were told by
mid management that top management said "Anyone playing computer games
will be fired immediately!" and having a computer there was pushing our
luck.

It was a 'matrix organization' type thing. IT eventually forced all the
in house computers to boot from the net and removed floppy drives from
all the computers so you couldn't boot them any other way.

I don't know if it was fear of losing their jobs or if they were sincere about micros. The irony is no one in IT lost their job because of PCs. Matter of fact, the IT department grew as the number of computers rose.

>
> The lack of Basic (or other programming language) is not a hinderance
> if you are aiming for a larger market.

True now but there is a time honored marketing scheme that predates personal computers. It characterizes people as 'early adapters' or 'laggards' with a category or two in between. Part of the concept is there is nothing you can do to get the laggards to buy so you focus on the early adapters. IMO the early adapters are the ones looking for languages/development packages.

Second phase for computers was probably the killer aps written by early adapter types. WordStar on CP/M, Visicalc on Apple, Lotus 123 on the PC, kind of stuff.

We are well into the third phase now which I interpret to be: Too Late for Atari or anyone else for that matter.

Not permanently,really. Sorry for the inconvenience. Last week the raid controller of our file server freaked out. Our staff then moved the disks over to an older system, and that's not really designed for the current load, so it breaks down from time to time. I'm not really sure when the raid hardware arrives, and it's really pressing now - I don't have a home, and no mail... Stay tuned, and have some patience.

So long,
Thomas

And I even more, with the backsteps in graphic arrays.

Why should I wait Tenths of Years, just to see it again with a 256
shades of c00lour, per pixel. And that in times of GfX Cards, showing
over 16.8M Colours. At once!
And only one resolution! What a shame...
Should I throw away all my Computers with VGA connection possibilites,
and use Longhorn Windows Based in only one fixed resolution!?

Antialiasing things, to break back the barrier - making it back blurred
:).
This side of development is extremely refreshing to me.

Let it crisp!!

:-)

Best Regards,

Daniel Mandic

> for Atari or anyone else for that matter.

The third phase? Hmmm, we know that it's too late for Atari, Commodore, Tandy, and any of the others that have come and gone. Apple appears to be holding its own and, remarkably, seeing some growth. But then, the adoption of Intel processors and the ability to run Microsoft Windows probably is playing a big role in that.

I don't fully understand your comments on the third phase being too late for Atari and anyone else. If I might hazard a guess, and please correct me if I'm wrong, you appear to be saying that we've settled on a standard that has pretty much been set in stone. The idea that anyone could emerge from the ether and upset that standard is mere fantasy. If that's what you're meaning by a third phase, then I would agree with you.

I think, and this is largely an ignorant bystanders perspective, that we're moving into a phase of transparency. I think the idea of the singular PC is going to be replaced with a more seamless and transparent concept of what computing is and should be. Meaning, the old ideas of disks and storage devices will be replaced by a broader and less finite concept of 'information space'. I think we're going to see that the whole idea of the Operating System will be lost as people are pulled toward the application as the system and information as the appliance.

I know that visionaries like Bill Gates have long spoken of the 'information appliance' where computers become such a vital part of one's life that they almost become synonymous with such devices as the toaster or the coffee maker. The way that toast is made or who or what allows it to be made is inconsequential. We know that we have bread and we know that we don't want it to be bread anymore. We don't care how the bread becomes toast, we just know that it must become toast in order for it to be of any use to us. We don't want to think about the toaster or how it works -- we don't care.

For the most part, I would have to say that companies like Apple have done the most in bringing this to us. Firewire, for example, an Apple technology, frees us from having to think about how we connect devices to our information appliances in order to get the results and information that we need and expect. The same is true for USB. With a single interface,

we are able to connect everything and the kitchen sink to our information tools and not have to worry about silly little technical details.

The graphical user interface has liberated us from cryptic and difficult to remember command line interfaces. The Internet and ethernet networks have made it possible for us to share information seamlessly with peers and other information devices around the corner and around the world. The idea of using the computer as an information device is becoming incredibly blurred. I believe that we will eventually lose the notion of using computers and become more focused on the idea of using information.

I was gonna type a long-winded diatribe here, but I think I'll stop here.

Here's another vote for the Wico Command Control joysticks. I have several now, and had one that I used daily throughout my teen years that still worked 20 years later. I've been able to find a couple at thrift shops locally and bought them for under $10.

As for them not being good for decathalon and other "joystick breaking" games: that's what the crappy atari joysticks are for. Never liked those mushy feeling things, and didn't cry if one got broken trying to run the relay.

Hi,
I was wondering how to access the R-TIME features of Atari800Win.exe or Atari++. Can this be done via peeks or pokes with basic. I am wanting to add time stamping to a calendar program. With SpartaDOS it is on the COMTAB but with MyDos or Atari 2.5 even with the time handler loaded I am still having troubles getting my current date to highlight..

TIA
RoyE

FYI, the same thing will happen again Thursday, 8pm to Friday, 10am,
CEST. The fileserver is again under repair. It's likely not the last
time since there's not yet a replacement for the newer, but still broken
machine.

So long,
Thomas

AMD is alive in the processor market too.

Third phase is when people buy them w/o knowledge, thought, or
consideration. The laggards are the ones still waiting for color TVs to
be perfected and the cost to drop before they buy. As a few instances,
Garmin hand held GPS use Intel processors and cell phones use one type
or another of micros. Anyone who drives a car built in the last 20 years
probably has a microprocessor or two. For the laggards PCs are in the
same appliance category as a typewriter or toaster now.

Not that I am an early adapter or anything, but my first system was a
1.79 mHz COSMAC Super Elf 1802 with 256 bytes of memory and a 1861 video
chip. My $10 PDA came with a megabytes of memory and arguably a better
display.

I thought Apple was doing well because of the Ipod. While it is a
computer in the same sense as a cell phone is, it is the only third
phase product any of the big computer companies got to market.
>

I don't regard Bill Gates as a visionary, Steve Jobs either for that
matter. Some wag once paraphrased Archimedes taking a bath 'Steve
Wozniak took a bath and Steve Jobs noticed the level of water in the tub
rose.' More like really good opportunist.
<snip>
> we need and expect. The same is true for USB. With a single interface,

Actually for USB the same Atari guy<forgot his name> who did POKEY, SIO,
and work on the Atari 800 is a co-inventor of USB. When you think about
the Atari SIO chain with intelligent devices sharing a common serial
connection it becomes pretty obvious. The latest rage of IBM utility is
just an updated version of 1979 technology.

The SpartaDOS Construction Set manual, (130 pages) has
XIO commands to use from BASIC with the Z: handler
installed. This should work with any DOS. However, you'd
have to have the emulator emulate the R:TIME8, which
I didn't know could do, which you indicate there is such feature.
I could send you the SPDCS manual, I think you have put
a space character in your address, so if you want the SPDOS
manual, lemme know.

Hi Russg,
I have the SPDCS manual and know about setting the handler and the XIO codes
but my little calendar program only works in SpartaDOS, I want it to be
the same for Sparta and Mydos, Atari Dos 2.5. Just hoping for a quicker fix
than just using the handler in Mydos.. Even just using the jiffy clocks at
18,19,and 20 works.. Thanks for the offer..

OK.
If your program works in SpDOS, but not MyDOS, then
you're using the TIME/DATE functions of SpDOS.
If you're using 18,19,20, then it should work any DOS.
If you're doing this in an emulator, you're not using a RTIME8
cart.
Mapping the Atari has reference to Compute! and DeReAtari
programs that use 18,19,20, I guess setting up a VB
program that installs and stays working after exiting
the program, like TDLINE of SpDOS.

The stick and all of the switches of the Wico models were near
indestructible, but their weakness was the cable; I have replaced two
because of fatigue breaks in the interior conductors near the strain relief
on the side of the stick base.

Well, at least scan codes can be blamed somewhat on the layout of the
keyboard. Maybe that explains the seemingly random arrangement of
the PETSCII graphics accessed by the Commodore key...

I'm thinking of buying and XEP-80 80 column interface for use with my 130XE. Has anybody input on how useful it will really be. I'm concerned that it will be one of those things sounds great but has so many compatibility issues that it's not really that useful.

Thanks,
John

The best explanation why screen codes are not equal to ASCII/PETSCII codes
is propably the ECM mode which limits the character set to 64 characters.
If you wanted letters + numbers within this range, you could not use
ASCII.

Each CPU cycle has a cost of about a millisecond.

With PETSCII you might have a point, because it had a lot of
non-printing characters, and strays from ASCII in many illogical
ways, most of which involve the use of the high bit.

But with ATASCII in particular, the argument doesn't hold for two
reasons:

1. practically the entire character set is printable, and
those that aren't can be printed by printing the ESC character
first. The shape table in ROM could have been arranged to map to
ATASCII exactly, using the same amount of memory.

2. The ANTIC graphics chip creates reverse characters in hardware.
Only the first 128 character codes can be defined in memory in
40-column mode. The hardware inverts the bitmap whenever the
high bit is set in text memory. And this is also how you write
inverse characters in ATASCII: add 128 to print the reversed
character. CHR$(65+128) is a dark A on a light background.

>>Also, what's the deal with the backspace?
>
> Well, remember that even "real" computers couldn't get DEL and BS
>straight!

Real computers can't get CR/LF straight, but at least we know that LF
used to mean "advance the paper one line" and CR used to mean "move
the print head all the way to the left".

>of the character sets to a large degree.

I didn't think of this. Suddenly it seems much more logical.

I'm surprised I didn't think of it earlier, especially since I used
to GRAPHICS 1:POKE 756,226 and get a screen full of yellow hearts.
It just occurred to me that that's what GRAPHICS 1 mode would look
like if the character ROM were programmed to match ATASCII's layout.
These 20-column color modes have access to only 64 characters, and
the first 64 characters of ATASCII have no letters.

The Commodore 64 has a similar color mode, where the two high bits
control the background color. And it occurs to me that the Commodore's
character ROM also has it set up so the first 64 characters are the
most useful. I wonder if it was the same way when Commodore was making
those monochrome PET machines, though.

I don't think there was a "flow of time" spell in Archon II......only the
original Archon.

The previous poster explained exactly what it did.

In Archon II, there were no dark and light cycles of time.

I guess it all depends on your expectations?

If you want to do 80-column text-based word processing on your Atari, AtariWriter 80 on the XEP80 is a great combination. Other text editors: Turboword, an emacs subset, and a macro assembler/text editor-- MAE.

For text-based telecommunications, BobTerm works very well on the XEP80. There's also VT850 and, to some extent, Kermit-65.

Other text-based activities that work in normal graphics 0 mode, like Atari BASIC or BASIC XE, can be done nicely on the XEP80. SpartaDOS X supports the XEP80. DOS 2 types normally work also.

Also, for serious time on the XEP80 you'll really want a composite monochrome "80-column" monitor. Your color "40-column" monitor won't do the XEP80's display justice, and may not even be able to display the whole screen.

If its been in storage that long, then I'd suggest at least prying up all socketed chips, then pressing down on them to re-seat. This includes the CPU board under the metal cover.

If this doesn't help, then each chip may need to be removed and pins cleaned. Use static precautions.

Hi,

The XEP80 produces a true 80 column, not emulated or using gr.8. Makes
for a superior display and usually ram savings.

The following only applies if you are using standalone software or
commercial apps that know about it.
Using a text editor is far easier, particularly previewing your work in
80 columns lets you see where returns are misplaced.
Terminal programs go easier, less scrolling. Spreadsheets and databases
show much more information in fewer screens.
Programming in a language like basic can be easier, but you are usually
limited to 79+EOL characters/line.
Ultimately, anything pure, plain text based can be much easier and faster
with 80 columns. Anything else is better with the
flexible graphics power if the regular atari display.

As Zaphod mentioned, I don't recall this spell in Archon II so this answer is relevant to Archon I only:

The best use of the "Shift Time" spell was to use it when the colors were all the way toward your opponent. For example, if you are playing the light side and the board is completely toward the dark. Casting the spell at that moment will cause the board to shift completely toward your color immediately, likely stranding lots of the darkside pieces on now white squares. This takes a bit of planning to be most effective, since you'll want to pounce on some of them ASAP.

Other than that, it simply reverses the light->dark->light flow. The main reason I can see someone doing this is to prolong the effect of an "imprison" spell--cast "Shift Time" the turn before the colors are all the way toward your opponent and the piece will be imprisoned for several more turns.

Hi,

Atari printer ports are all one way, and as far as I know even for all of
the hardware expansions. So these types of devices will not work.
It is possible to make a bi-directional printer/parallel port(three joystick
ports can be made into this), but you still need software. Probably a
driver is too big, but a read/write app will do.

I use a 100 meg zip drive on my Portfolio parallel port. Works great. I
want to test my backpack cd drive, probably on the pc laptop.

Hello,

I have added several new items to my lineup:

To the 8 bit a/v breakout box, I now have a mono audio/svideo cable. S-Video uses video and luminance for all 8 bit with a monitor jack. The picture is really quite nice, in 6' and a 12' lengths, $14/$18.

To the Jaguar a/v breakout box, I now have a stereo audio/svideo cable. It also has a short phono plug for composite video. 6' and a 12' lengths, $16/$20.

In addition to the two 850 interface R:9-25 and P:15-25 adapters:, I now have an R: 9-9 pin adapter.

See more information at:www.a8maestro.com/sites/mtgcat/mtgcat.htm.

More new items appearing soon.

Rick D.

Source record: 6029

Which side had better creatures, "order" or "chaos" ?

I'd much rather be ORDER. I liked the creatures fighting ability much more.

order chaos
---
giant behemoth
fire salamander firebird
thunderbird ifrit
squid/kracken siren

The Giant was slow, but range of only touch made the behemoth useless.
The salamander was pretty good. I hated the firebird and didn't see how it
could ever win.
The thunderbird vs. ifrit was pretty even.
The squid/kracken was slow but did large damage in close. The siren had its
uses (time & place) but overall it was fair at best.

And everybody shared the same demons!

I've been a member of two user groups over the years, BASIC (Bluewater Atari Systems Information Club) and SMUG (Sarnia Macintosh Users Group) and neither of them ever held their meetings at a pizza shop. I was thinking that I may have attended a few more meetings if they had. ;-)

I attended a few of the local Commodore user group meetings several years back, and even managed to finesse my way into becoming a sysop of their BBS, The Inside Track. I'm trying to remember the name of the BBS software that they used. For some reason, CNET rings a bell. Does that sound about right to you? The BBS ran on a Commodore 64 with two 1 MB drives. It was quite an active system.

Heh, I was curious as to why it's billed as an "emergency" convention.

That actually sounds like a good idea. I've had several old machines where some corrosion had formed on the pins of the chips and prevented good contact with the sockets. It might also be a good idea to look at the traces for signs that the traces have bubbled and broken. I've seen this a few times on old boards too. Although, the fact that everything but the keyboard works, probably eliminates this possibility.

At the last TAF convention that I attended, there was a guy there who was using an XEP80 with a TTL hack. The hack allowed him to connect older TTL PC monitors to the XEP80. The display was much crisper and easier to read than you would hope to muster with a composite monitor.

I believe the XEP80/TTL hack is quite well documented on the Internet and should be relatively easy to locate with a Google search.

Okay, let's put our thinking caps on and think about this problem like a computer technician would. We have a problem that needs to be fixed and we know what the problem is: the keyboard doesn't work.

So, the first thing we have to do is focus on the likely culprit. We know that the problem exists in one of three areas: (1) On the computers logic board, (2) in the keyboard itself, or (3) in the connection between the keyboard and the logic board.

We know how the keyboard in the Atari computers work. There is a matrix with contacts that correspond to each key on the keyboard. We know that the Atari computer applies voltage to the keyboard, and a line is taken high when a key is pressed and completes a circuit. The line that goes high is interpreted by the computer and an ATASCII character is generated and displayed on the screen.

We know that there are no dangerous voltages inside the Atari computer so we know that we can play around with the machine in a powered state without risk of electrocution or personal injury. So let's play.

First thing we're going to want to do is isolate the source of the problem. This can be done by opening up the computer, disconnecting the keyboard and powering the machine up. Without a Basic cartridge in the slot, this should give us the Atari Memo Pad on the display.

We know that shorting the pins on the keyboard connector should produce characters on the display if there is no problem with the Atari computer itself. So let's do this. Let's bypass the keyboard entirely and short pins on the keyboard connector to bring the signal high. If we get characters on the screen from doing this, then we can eliminate the Atari logic board as the culprit. From there, we can move on to the next two possibilities: (1) The connection between the keyboard and the logic board, and (2) the keyboard itself.

Assuming there is no problem with the logic board, and characters are displayed on the screen when we short pins on the keyboard connector, we can shift our focus to the keyboard. Using an OHM meter, we can test for continuity on the connector of the keyboard. What we're going to want to do is attach the probes of our OHM meter to the keyboard contacts and press the keys. If our OHM meter shows anything other than zero when the

corresponding key is pressed, then we know that there is no problem with the keyboard itself. Check every key this way before eliminating the keyboard as the likely culprit.

Conversely, if the OHM meter registers a value when no key is pressed, then we can assume that there is a short in the keyboard somewhere. This short would likely be our culprit. We can then proceed to check the keyboard for possible causes of the short.

Finally, on to the final possibility, the connection between the keyboard and the logic board. There is not much testing that we can do here. We'll either have to do some serious cleaning of the contacts, replace the contacts, or beef up the contacts somewhat to ensure that electrical contact is being made.

Give this a try and report back. If the problem originates from the logic board of the Atari, then further troubleshooting will be necessary.

Good luck.

I had a rare SP error with an XF. It got lost and scrambled a disk. In general no problems though.

The XF itself has a problem or two. It doesn't always switch densities right. Best to cycle the power on the drive and hope it comes up right.

You mention joystick problems.

POKEY has nothing to do with joysticks - it only handles paddle inputs.

Joystick directions go to the PIA, the fire buttons go to GTIA.

hi Russ,
just answering my own query about Atari basic and Mydos. I loaded
Rtime8.com as an autorun file with basic enabled. Rtime8.ar0 this gets the
time init and memlo set before dup.sys gets loaded, drops straight into
basic. I then loaded programs and reset variables via "Z:" ,xio commands,
GET #1,MO:GET #1,YR, etc... I was using the formatted time XIO earlier #'s
33 & 35 are the unformatted XIO numbers.
and this line helps with the Highlighting characters..
900 IF RX=DY+(DAY-1) AND RM=MO THEN FOR H=1 TO
2:RX$(H,H)=CHR$(ASC(RX$(H,H))+128):NEXT H
Thanks for responding
re-reading the manual helps.

->I remember being limited to 30 minutes on Itsy Bitsy. At 300 BAUD
->*IF* I tried to download an 8k file, it would log me out at 7.8k
->when my time limit was exceeded.

One of my great stories from the 8-bit age involved a 20- or 30-minute-long graphic cartoon about oil-drilling with the filename "oildemo.com" or something like that. It was a serious industrial promotional item and arguably one of the best files available on the Atari club's BBS. Unfortunately, it was "huge." In the 300-baud days that meant 35K or something.

On my first attempt to download it, I timed out. At that point I knew my only hope of successfully D/L-ing it was to start at the very beginning of my call, because theoretically it would take 38 minutes to D/L it. I also prayed for rain because the 300-baud connection seemed to work best in thunderstorms. (That joke is based on another occasion when some monster file, like 250K or something, was successfully transferred on a direct connection -- what did we call it in those days? Full duplex? -- between my Atari mentor's and my Atari 8-bit computer at 300 baud *ONLY* during a thunderstorm!)

Nowadays when I'm downloading files I always say to myself, "And to think that it took *38 minutes* to D/L that oildemo file! Today it would take about three seconds!"

Is the .pdf referenced by this link the most full and current
SpartaDOS documentation?
http://www.strotmann.de/twiki/pub/Infothek/RefSpartaDos/spartadosreference.pdf#search='Spa
rtaDos%20manual'.
I'm looking for the most current documentation for SpartaDOS 3.2 and
SpartaDOS X, preferably in electronic form. The .pdf doesn't say
what version it's for (unless I missed it), but it does reference
v3.2 in the R-Time 8 supplement. The .pdf also makes several
references for version v1.x and v2.x. It looks like the author was
trying to create a comprehensive document to cover all versions of
SpartaDOS.

I have found this reference to the SpartaDOS X Manual,
http://www.celebritybase.net/atari8/SpartaDOSXManual/, but it is an
abridged version of the documentation. Ideally, I'd like to find
FULL version of the manuals.

Thanks,
John

Not sure if this will help, but you may want to check the SIO ports on the
drive. This is a trouble spot. Alot of XF551 drives SIO ports are not
soldered
properly and one can easily have a loose/broken soldering connection on the
SIO ports.

Also do you have the DOS disk that came with the XF551?
If so, try booting it up and also try booting up a DOS 2.5 disk.

BTW, in the PC don't forget to configure the raw drive as a 360K, 5.25"
model in BIOS Setup.

On the drive itself Drive Select should be set to 1 (DS1) if you are
connecting after the "flip" in the ribbon cable. If you are connecting
before or without a "flip" then Drive Select must be set to 0 (DS0).

Ooooh, I have that one. I purchased it on a PD disk from the old Bellcom Public Domain library in Peterborough, Ontario. Does anybody remember the old Bellcom Public Domain library? Come on, let's here it for the old Bellcom Public Domain library. ... A few groupies, huh?

Sorry, that was a take on the Wizard intro from the Speak of the Devil album... Ozzy Osbourne, ya know?

Three seconds? Man, you have a slow connection. LOL If I were to attempt to download this file today, the transfer would be complete before I even moved my mouse away from the hyperlink. :-)

Ya know, I always wondered why Atari put the utterly useless Atari Memo Pad in the ROMs of the 400 and 800 computers. I'd hazard to guess that they probably could have fitted the old Pong game in the same memory space and offered something a little more reminiscent of the cool computer/gaming company Atari once was. But to each their own.

My point exactly. When I was a member of the local Atari club, they met at a local high school (St Clair). Oddly, when I first joined the Atari club, I was not even old enough to be a high school student. Later, when I had moved on to the Macintosh platform, the meetings of the local Mac user group were held at an elementary school and moved to the local college before they finally put an end to the group. The meetings of the old Commodore user group were also held at the local college.

As I recall, it was a fairly decent piece of BBS software. If I'm not mistaken, the majority of the code was written in the Basic language and was highly customizable. The ironic part of the whole thing, was that I managed to become a sysop of the Commodore user group BBS even though I had never actually been a member of the club or even an owner of a Commodore computer.

Well, I did own an old Commodore Pet for all of about a week. I ripped that sucker apart almost as soon as I got my destructive little paws on it. But it was all in the interest of science. ;-)

Pretty sure you have to change the jumpers on the drive to D1: if you
are using a standard IBM stype cable.

While you have it in the MS DOS machine, see if you can pick off the
data with ANADISK. Somebody from the Atari community, maybe Preston
Crow, also wrote "DEANA" which properly flips bits in an Atari disk to a
readible format.<Atari writes its bits inverted!>

From there you should be able to hack it or write it to a new disk.

Pay attention for errors when using ANADISK. It may tell you exactly
where the error is.

Of course I did..... D1 for IBM, D0 for Atari...

I found the Weltec brand name 360K drive in junk room. IBM can read the DOS... The drive was hooked up to XF551. It can read the Atari formatted disk. I am worrying about the heat sink is very hot in XF board if the drive requires high watts. Mitsumi D503 offers low watts.

Original Mitsumi D503 that comes with XF551. D503 was broken. Cant read the formatted disk. Black colored D503 is found in ebay and sold to me. The black one can read the formmated disk, no problem. Later, SpartaDOS 1.1 HS boots up. The D503 was become broken again.

Do you think the software can destory the hardware?

I do not know which is the best file copier for Atari 8bit. Like C64's Fast
Hackem File Copier and Maverick file copier. They are much easier and quick.
I hate the command for DOS, there are too many files I select to copy.

Any idea?

Are you looking for something, like get a list of files on screen,
with a box beside it you can check, then copy the checked ones
someplace? I don't know of any like that for Atari8, there may
be some. How do Hackem and Maverick work?
Good use of wild cards can be a big timesaver, but there
we're using a command line, even with MyDOS/DOS 2/2.5
'copy' function.
SpartaDOS has the MENU.COM program, it probably will
do what you want. It takes some getting used to. It has
5 banks of choices to make, you select a file to operate
on with the RETURN key. F RETURN lets you select
the drive to work on, etc. You can select which files on
a disk you want to copy (highlight them), then you can
select the destination.

This is really easy -- NO! -- unless you are a collector.

The XEP-80 is probably the worst major product ever released by Atari. You can likely count the applications that supported this product on one hand. The only decent application (IMO) is AtariWriter 80; however...

the XEP-80 overscans a conventional display both vertically and horizontally, and that can't be fixed without re-coding the XEP-80 rom(s). The horizontal overscan can be tolerated somewhat, but having the bottom line(s) cut off is pretty tough to deal with.

I successfully ran a (modified) XEP-80 on a TTL-type monitor in monochrome, and I was just *barely* able to fit AtariWriter 80 on the screen. After much experimenting, I was also able to get 80 X 24 on a VGA doubler that supported monochrome input (many don't support mono.) In order to do this I had to use the "DScaler" display drivers and really play with its settings. But it can be done. BTW, Atari specifies this as an 80 X 25 display, but IIRC, the 25th line is not normally visible or directly accessible -- can't remember for sure.

How the XEP-80 got released like this is probably a very interesting story -- I wish I knew it.

Although there have been a number of software 80-column implementations, the best is ACE80 XL. It was released in an OSS-type bank-switching (black) cart, and very hard to find. I got an original cart a few years ago, but never have seen the docs. It is the fastest 80-column software product that I've seen. Second would be Omniview. It was released in several flavors: XL, XE, and 256 to name three of them. It has the advantage of being an 800 work-alike OS, so it doesn't take away memory plus it has several 80-column applications that are of some value. It has readily-available docs, too.

Bottom line -- save your money and (probably) garage space! -Larry

The drive "breaks" everytime you use that one particular diskette?

Did you try a head cleaning disk? I've had plenty of bad diskettes
over the years that leave deposits on the heads, mostly because I
purchased lots of cheap diskettes.

Do you have any other DOS disks to try?

If don't have any other DOS diskettes I found that Hias Reichl's WriteATR does a great job of porting ATRs on a PC to real Atari diskettes. Only caveats are you have to write double density diskettes and the resulting disks work best on industry standard drives. The latter is not a problem because you are using an XF551 and the raw drive is one and the same for the PC and the Atari.

Right. You can't substitute drives into a XF551 unless they are low
power. If it isn't a Mitsumi maybe a notebook/portable drive would be ok.

Time has made me a little foggy on the events that surrounded the XF551.
Story went something like: Jack Tramiel was in the middle of a lawsuit
with Nitendo and they fired back Atari was a game consol because Atari
was not selling a disk drive. Tramiel ordered one of the engineer
wizards still left at Atari to get a drive out ASAP. In typical fashion
it was made up of obsolete and discontinued parts with the cheapest
possible execution. I mean they didn't even use a double sided circuit
board, just single sided with jumpers! Likewise the 12V power supply is
bare minimum ~LM7812T which is 1.5 amps max. Most drives of the day
needed ~2 amps to spin up.

BUT that was the way everything was done at Tramiel Atari. Even the ST
came with a 360k single sided 3.5" drive.

No. I can only think of a couple of computers in the last 30 years where
that could happen and the XF551 was not one of them.

What I think happens with the XF is a rogue write to a disk. For
instance you have a double density disk and it writes a single density
sector to the directory. The XF has problems with switching densities
and I.D.ing what densities disks are. This is based on using ANADISK
with some scrambled disks I had. Could be something like a bug that
doesn't let the drive spin up before writing too. Most of my problems
were when I switch disks. Stuff like putting in my Action! single
density disk with runtime package and then stuck in a double density
disk to write the program out.

Once the disk gets scrambled, any drive that gets put in will have the same hangup when it reaches that bad sector.

If it is the only 5.25" Atari drive you have, you are stuck. If it was me, I would:
1) Just stick a 3.5" 720k drive in it and use it as a 360k. It only uses 40 of the 80 tracks, but will run cool and be reliable.
2) Find a Wooley ROM, or Puff upgrade ROM and use a 720k 3.5" to its full 720k.

Note you really have to find a 720k drive unless someone can tell you how to get a 1.44 to work. Both upgrade ROMs take care of stepping and other parameters to get the 720k to work right. Figure the average Atari game was probable 8k, so you can fit ~90 games per disk.

Subject: VCF 9.0 Marketplace

The ninth annual Vintage Computer Festival is happening this November 4th and 5th at the Computer History Museum in Mountain View. We are anticipating another large turnout this year because of the fantastic line-up of speakers we've assembled, including Steve Wozniak with other early Apple employees, Lee Felsenstein, and more. We've also got new features, including Build-It-Yourself workshops and a film festival with a vintage computer theme. Because of these features we expect to get a good amount of press leading up to the event, which will result in more exposure and higher attedndance.

There's still plenty of time to book a booth in the Marketplace at the Festival. The early-bird sign-up period extends through October 7. Currently, booths are $150 each, but will go up to $175 after that date.

Book your booth early and get a prime spot! The Marketplace layout will be similar to previous years, with the prime spots being located near the entry and exit doors.

To book a booth, contact me by e-mail for payment instructions and booth selection.

[snip]

Best regards,

Sellam Ismail
Producer
Vintage Computer Festival

<snip>

This doesn't make sense to me, and you'll have to excuse me for thinking this information suspect. Atari had been selling disk drives for the 8-bit line of computers since the 810 drive was introduced. Atari was still producing and selling the 1050 drive during the time of this lawsuit, and there was no time in which Atari was selling 8-bit computers without optional available disk drives.

To the best of my knowledge, Atari has _never_ bundled disk drives with their 8-bit computers. The disk drives have always been an optional additional peripheral for the 8-bit machines. And for purposes of litigation, a disk drive is a disk drive is a disk drive. The color and style of its outer casing is, as Perry Mason or Benjamin Matlock would say, irrelevant.

My recollection of how the XF551 came to be, differs drastically from yours. Atari users had been expecting a new drive out of Atari for a very long time. There had been much rumour circulating that this new drive would be a 3.5" drive. Atari, however, after consulting with several third party software developers and distributors, learned that there was much reluctance to producing Atari 8-bit software in the 3.5" disk format. As a result, Atari opted to create a newer 5.25" disk drive instead. The result, of course, being the XF551.

<snip>

> *BUT* that was the way everything was done at Tramiel Atari. Even the ST
> came with a 360k single sided 3.5" drive.

<snip>

Only the original low end ST (260 and 520) machines came with 360k single-sided drives. The 1040 ST machines always shipped with a double-density 720k drive, as did the later 520 revisions and the Mega series, etcetera. Additionally, the original 520 ST machines shipped with external disk drives -- not the internal drives that we tend to associate with the ST series. Atari eventually began shipping the 520 series in the same casing as the 1040 to cut costs. Shortly after this move, Atari

began shipping the 520 series with double-density drives as well.

Any old Atari sysops out there (or anyone else for that matter) who had FidoNet experience back in the day?

I contacted the FidoNet site, and they said they would love to have Atari BBSs back with FidoNet...

FidoNet was something I never tried back when I had my BBS in the 90's so I've got no first-hand experience at all.

Any comments, suggestions, etc, welcome.

Thanks.

I have a program that I wrote in Turbo Basic XL that needed a 130XE with at least 192k memory and was designed to be used with Dos 2.5 that handled the typical things you would want to do. It's features included selecting a source and destination drive (could be the same) having a list of files presented from the source for copying. You would select which files you wanted, you could even rename them before they were written to the destination as well as have them sorted before being written. In addition to copying there were options for just renaming or deleting files and getting a directory of a disk (a full directory with sector counts, or just the files listed). Also some options for formatting a disk or duplicating a disk sector for sector (single or enhanced density only). Everything was entered with single keys with options displayed 99% of the time so that if you hit the space bar it would automatically select the indicated option, or press Escape to cancel.

Forgive me, I ramble a bit. If this sounds like it would be useful I can send an ATR file with Dos 2.5,Turbo Basic and the copy program on it. You would just have to boot it or load Turbo Basic from it to get going.

Lawsuit wasn't filed until ~1989 IIRC. This was a long time after the
last 'new' 1050 had been manufactured. If you have a 1050 with later DOM
chips in it, I would like to see it. For that matter, anyone with an
opened 1050 I would like to hear the chip DOM dates.

That was not rumor, that was 'official press release' which makes it
suspect IMO.

I stand by my criticism of the XF551. The floppy controller was left
overs/inventory from ST line. Vitually unavailable and 'not recommended
for new designs' when it came out.

There was no RAM chip in the design, only the 256 bytes on the 8052 was
available.

Speaking of the 8052, it came with 8K ROM on it! The 8052 internal ROM
is disabled on the XF551 and an external ROM contains the program. This
led to speculation at the time that these were preprogrammed overruns
and bought garage sale like by the Tramiels. There was a cheaper 8532
ROMless version available that could have been used as a direct replacement.

I am aware eventually Atari saw the light, too late! Software
manufacturers had to distribute software on 360k single sided disks if
they wanted to be sure of compatibility just like virtually all 8bit
software was distributed on 88k single density disks.

What did they save? Couple of bucks in $500?

7572. Atari BASIC string arrays?

Newsgroup: comp.sys.atari.8bit
Date: 2006-09-20 20:10:02 UTC
From: "JohnH." <john@jrcc.net>
Message-ID: <1158783002.319351.256330@i3g2000cwc.googlegroups.com>
Source record: 5879

Long story short, I'm using Atari BASIC rev c. I am writing a routine that needs to display values in hexadecimal notation. I thought I would create a string array, H$, of the characters 0123456789ABCDEF. I would then use the values 0-15 as an index into the string array to pull out the appropriate character.

```
DIM H$(16)
H$="0123456789ABCDEF"
? H$(11)
```

Result: ABCDEF

There does not seem to be a way to pull out just 1 character from the array, something like sub-string functionality. Is this just the way it is with Atari BASIC, or am I missing something?

I came up with a work around by loading a numeric array with ATASCII values for the characters 0-F, but now I'm really curious about the string/sub-string functionality.

Thanks,
John

I don't know when they stopped manufacturing the 1050 drives. I just know that new 1050 drives were available for sale well into the nineties. This may have have been remaining inventory that was in the supply chain -- I don't know. When was the XF551 released?

>> My recollection of how the XF551 came to be, differs drastically from

>

Huh? Anyway, what I was disputing was the idea that the XF551 was a spur of the moment creation. My recollection is that Atari had been teasing the 8-bitters with a new drive for a long time. Almost as long as the XE line had been on the market.

I recall Commodore having released a 3.5" drive for the 64 and 128 machines, and that Atari had been toying with the idea of doing likewise. There had been much speculation that Atari was going to produce a 3.5" drive, and I think Atari may have even fuelled that fire themselves. Anyway, Atari did eventually release the XF551 and I distinctly recall a lot of Atari 8-bittes being disappointed that it was not the 3.5" drive that they had been expecting.

Atari -- Sam Tramiel I believe -- did publicly state that the decision to produce a 5.25" drive in lieu of a 3.5" drive was due to the fact that software vendors were unwilling to incur the additional cost of distributing on that medium. My guess was that Atari really wanted to

release a 3.5" drive, and if software publishers had cooperated, Atari could have really boosted sales of their drives. The Atari 8-bit faithful would have had little choice but to upgrade to the newer 3.5" drives.

Regardless, the point that I was trying to make, was that the new drive had been on the drawing board for quite some time, and that Atari had been dragging their heels in bringing it to market. My recollection of history, as it pertains to the XF551, is that the XF551 was _not_ a "get it built and out as soon as possible" type of thing.

> I stand by my criticism of the XF551. The floppy controller was left
> overs/inventory from ST line. Vitually unavailable and 'not recommended

>

I'm not disagreeing with you on this point. I have never owned an XF551 nor have I ever had any experience with one. I cannot speak for the quality of the the drive. Also, I'm in total agreement with you in your assertion that the Tramiel Atari did everything on the cheap.

What you need to do is specify the first and last character in the string
that you want.

Example:

```
DIM H&(16)
H$="0123456789ABCDEF"
? H$(11,11)
```

Result: A

```
? H$(11,12)
```

Result: AB

```
? H$(1,9)
```

Result: 012345678

Minor error in the above. There should be a '$' in place of the '&' in the
DIM statement. Sorry about the typo. :-)

AlbaClause wrote:

The Atari XF551 disk drive was released in 1987. This excerpt is taken
from page 22 of the May 1987 issue of Analog magazine.

"Latest news reports say the 3 1/2-inch floppy disk drive for the 8-bit line
has been scrapped in favour of a new 5 1/4. This drive is said to be
double-density/double-sided, and the A-DOS, previously developed for 3
1/2-inch drives is now being rewritten for the new drive. The new floppy
drive, we're told, is intended to be fully compatible with the 810 and
1050, as well as other drives, such as the Rana, Track, etc.

And what was the reason for the change? Many manufacturers of software for
the Atari lines were not wild about producing products for the 3 1/2-inch
format; they felt such production was too expensive to be cost effective.
Atari abided by the software developers' requests and remained with the 5
1/4-inch setup. Prices, availability and further information will be
printed in these pages as the information is released."

The following is taken from the July/August 1987 issue of Analog magazine.
From the editorial:

"...this summer's CES had Atari Corp. concentrating on the new XE game
system. Actually, it a 65XE in video-game clothing.

...Atari surprised us with the XF551 double-density disk drive. It's a
super-sleek 5 1/4-inch drive, which will be priced at around the same level
as the current 1050 drive. Expect to see this, along with the 80-column
XEP80 display box and the 1200-baud SX212 modem, sometime in late July or
early August."

The following is taken from the September 1987 issue of Antic magazine.

"With the XF551 8-bit disk drive, Atari came up with at least one surprise
at a June, 1987 Consumer Electronics Show that wasn't supposed to bring any
new hardware announcements.

The XF551 is a 360K double-sided, double-density 5 1/4 inch disk drive that
runs 2.9 times faster than the Atari 1050. The compact, XE-gray XF551 is
about three-fourths the size of the 1050 which it now replaces."

So there you have it, Atari was still selling the 1050 disk drive when they
released the XF551 in 1987. The XF551 was announced at the same time as
the XE game system, SX212 modem, and the XEP80 display device. Prior to
the Summer 1987 CES trade show, it was the new Atari 3.5" disk drive that
was supposed to be announced at CES. Instead, Atari introduced the new
double-side, double-density 5.25" XF551 drive.

Sorry, I don't know of any good online references for Atari Basic. I'm sure that they exist, I just don't know where; I have a lot of paper reference materials at home (books and magazines). I'm sure that Google would be able to help you out with finding some decent online references.

I'm kind of glad that this subject was brought up; it motivated me to reread some of my old computer magazines. In the August 1987 issue of Compute!, there was a full report of the summer CES show. This is what that report says of of the Atari XF551:

"Also on the 8-bit front, Atari introduced a new disk drive that's compatible with the XE, XL and 400/800 computers -- but it's not the 3 1/2-inch drive that everyone was expecting. Instead, it's a faster, higher-capacity 5 1/4-inch drive.

The 3 1/2-inch drive for the 8-bit computers, which has been rumored for two years, seems doomed to oblivion. An Atari spokesman said that when Atari approached software publishers with the idea, only one company expressed interest in reissuing its programs on microfloppies."

I almost forgot that the 3.5" disks used to be called microfloppies. They don't seem so "micro" anymore -- well, with the exception of their storage capacity, which is very small.

On another note, Compute! magazine writes the following:

"TV scenes at the Atari booth were continuously showing previews of ST commercials. They are reminiscent of the aggressive spots that Atari Chairman Jack Tramiel successfully used to promote the Commodore 64 during the early 1980s when he was in charge of Commodore. In one spot, Tramiel's personal business philosophy -- 'Business is war' -- fills the screen with huge letters as the unseen narrator compares the 1040ST to the IBM PC and Apple Macintosh."

Quite cool, this little tour down memory lane. Turns out my memory is just fine, and I'm not crazy after all. Business is war, and surveillance is espionage. ;-)

7581. ATR8000 Question

Newsgroup: comp.sys.atari.8bit
Date: 2006-09-20 23:38:56 UTC
From: stephensheppard@hotmail.com
Message-ID: <1158795536.741485.98990@e3g2000cwe.googlegroups.com>
Source record: 5888

The ATR8000 is an I/O and disk interface for the Atari 8-bits but it can also be used as a standalone CP/M machine.

In section II.8, "Connecting an RS-232 Terminal to the ATR8000", of the owners manual (page 53 in my copy) it states,

"Step 3

Get a special terminal cable from SWP. This cable has an "ATARI" connector on one end that plugs into the COMPUTER IN Port of the ATR8000. The other end of the cable connects to the terminal. Connect the cable."

Does anyone know the pinouts for this "special terminal cable" ?

I know that I can use the A8 with ATRMON in 40 column mode or DT80 in software 80 column mode for accessing CP/M on the ATR8000. However, I would like to use a true 80 column device, in my case a PC running a terminal emulator program.

Yes, as RoyE says, www.atariarchives.org/basic
There's a whole book on Atari BASIC.
The standard, I would say, is "Your Atari Computer" by
Poole, McNiff and somebody. It is still sold on ebay.
Notably, Y. A. C. has a very concise, easy reference
to all Atari BASIC reserve words, in alphabetical order,
with examples, at the end of the book, along with a
concise section on runtime and BASIC errors, and also
an ATASCII list at the back. My copy is battered and
frayed, but still handy.

Thanks for the help but I guess I should have made it clear that I've already searched for the information but came up empty.

Both sites to which you linked essentially only have copies of the ATR8000 owners manual, which I already have. The information I need is not contained within.

I was hoping to find someone that either has one of the "special cables" and can trace the lines or who simply has the pinout information.

Yes, that is a very good book. My copy, too, is battered and frayed, and I
haven't flipped through it in a long time.

Another book that I use a little more frequently for reference, is simply
titled "Atari Basic" by Bob Albrecht, LeRoy Finkel, and Jerald R. Brown.
It too is battered and frayed, with an awful lot of dog-eared pages.

Interesting, I'd always just assumed that if you used a terminal, it
would just plug into the RS-232 port.

There is a section that describes some jumpering you have to do on the
motherboard to use a terminal. Maybe if you trace those changes you
might get some idea what signals go where. It sounds like a very
minimal RS-232 connection, with no flow control, so you shouldn't need
connections to too many of the pin

Hey, JR! Long time no see!

LOL! I probably should at least look.

Guess my line of reasoning is since ATR8000 doesn't have a UART I
wasn't going to figure it out. However, you could just be right.

Let's see. There has to be GND, TX, RX. Possibly DSR, DTR. What
else?

Argh, it's been so long.

It's late. I better wait until tomorrow so I do something stupid.
(I've been known to do that).

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

7596. How to print to screen escape characters?

Newsgroup: comp.sys.atari.8bit
Date: 2006-09-21 13:10:06 UTC
From: "JohnH." <john@jrcc.net>
Message-ID: <1158844206.094641.190940@d34g2000cwd.googlegroups.com>
Source record: 5903

In Atari BASIC is it possible to print to screen escape characters to the screen. For example

? CHR$(28)

Instead of printing the up arrow symbol, this actually moves the cursor up one line. I've tried putting the escape sequence in quotes. This puts the escape sequence character in the BASIC program listing properly, but at run time when the string in quotes is displayed the escape character does not display.

Is there a way to override the escape sequence behavior at run-time and get the escape character symbol to appear on the screen or is this just a feature of Atari BASIC?

Thanks,
John

7597. Re: How to print to screen escape characters?

Never mind. I just found the answer.

? "<Esc><Esc><Esc><Ctrl><Up>"

If you put the <Esc><Esc> character before the actual escape character
that you want to display, the escape character will display properly.

The points Nintendo made when Atari accused them of having a monopoly on
the video game market were:

***
They didn't take it over so much as Atari blew its market share though
bad business practices.

Atari was no longer in the market before the situation got to the point
of looking like a monopoly. Lack of a currently manufactured drive or a
video consol were two of the points they made to illustrate this,
prompting Atari to try and release the 7800 and XF551.
***

The 1050 was not an Atari designed drive, it was done by Tandon under
contract from Atari. At least some 1050s I have seen actually have a
Tandon sticker on the ROM. Tandon as a manufacturer ceased to
exist/facilities taken over in 1987 by Western Digital. The Tramiels
also sold off Taiwanese<?> manufacturing facilities but I can't remember
the year.

At any rate the 1050 robust design made it to expensive to manufacture
and it was an outdated format: Single sided double density. So we got
the XF551 which was a thrown together kludge with obsolete parts.
Understand I believe the designer did a brilliant job with what he had
to work, kind of like a cook of makes a 7 course meal from a bag of
beans and can of corn, but having his hands tied with costs and the poor
quality of manufacture undermined his talents.

BTW: Nintendo won the lawsuit => Atari argument that they were driven
out of the video game market vs. Nintendo's counter of Atari abandoned

it, lost.
<snip>
>>That was not rumor, that was 'official press release' which makes it

> had been on the market.

Atari practically invented "Vapor Ware", 'nuff said. That they happened
to actually deliver in two areas cited by Nintendo in a lawsuit is
beyond coincidence. That is why the allegations came out in the print
media at the time.

John, you only need one <ESC> before the control char.
like so ? CHR$(27);CHR$(28).
Typing <ESC> <ESC> gives you the ESC character.

ship again.

(Now my question/comment):

I think Atari won one suit against Nintendo for patent infringement.
Was it Antic/GTIA-type chips?
This isn't really on topic.

Can't use a null modem. Cable I'm desiring to build is RS-232-->SIO
port as per the description in the ATR8000 owners manual. The whole
point is to leave the normal serial port open for other uses.

I do have CP/M disks.

I think that's what he wanted. He wants to actually display the ESC
character.

> it, lost.

I don't know too much about this lawsuit, so I'm doing some research. I found this from www.pc-history.org/atari.htm and I'm quoting it below:

"The trial was a long one. Nintendo admitted they dominated the market and were a monopoly! However, their defense was that they had not acted in restraint of trade. They just provided a better product that people wanted to buy. In addition, they claimed that the many negative business decisions Atari had made cost them their position in the industry. Nintendo was not to blame for Atari's problems_Atari was."

So it was an anti-trust suit. Atari claimed that Nintendo's dominant and monopolistic stranglehold on the video game industry made it impossible for anyone else to compete. Nintendo countered that, while they were indeed the dominant player, and that they essentially controlled the market, Atari's inability to compete was due to bad management and poor decisions on the part of Atari Corp. Nintendo claimed that their success was due to the fact that they had just offered a superior product, and that _consumers_ chose to put Nintendo in its dominant position.

Nintendo argued that they could not be held liable for decisions made by consumers, who are free to buy whichever product they prefer. Further, Nintendo claimed, it was certainly not their fault that Atari made bad decisions that caused Atari to lose marketshare.

In all of my research, and I'll certainly admit that my research into this matter leaves much to be desired, I cannot find any instance or reference to the notion that Nintendo questioned Atari's unavailability of a disk drive. I did manage to find, however, information regarding litigation pertaining to distribution rights for Tetris. In that litigation, it was alleged that the Nintendo 'NES' was a personal computer. It was argued that the 'NES', because it had an expansion port, input devices, and used a video display, was essentially a personal computer. Nintendo countered that the 'NES' was not a personal computer because there were not devices like disk drives available for it.

Considering the timing, I would bet it came out during depositions. Not
to sure how familiar you are with the USA legal system, I am far to
familiar<sigh>, but that is the first round before you actually get to
court.

You do it in the lawyers' offices under most of the same restraints with
a stenographer there. They run everything up the flag during this phase.

I thought it was Atari Games/Tengen that brought this particular suit
and there was a disk drive available for the Nintendo. The thing is the
disk drive was a total disaster when introduced in Japan so it was never
sold in the USA.

OK, my bad.

I think I have this straight now; you are going to use an 80 column computer on the Atari style plug on the ATR8000 and RS232 on the computer.

I haven't had an Atari or my ATR8000 set up in the last 5 years. S.O. warpath thing. Been going through all my old stuff and it's breaking my heart: DR DOS 6.0 on Seagate ST225 gone. All my single board computers corroded and dead. About all I could fish out that still worked was a SX386 25 mHz.

Anyway, I will see if my ATR8000 is still alive. If it still works I would be interested in a trade, assuming you can't find the schematics to build the actual cable yourself. I'll try to reverse engineer the ATR8000 port and do an RS232-Atari plug-ATR in exchange for CP/M disks in 5.25" format.

I may have to drug my S.O. for a week to get away with it, but I am pretty sure I can get it done.

Well I hope I don't get multiple posts since my newsreader got confused
while drafting a response.

No, I've just got a hard head that goes by bits/inch definition instead
of sector length.

There were a lot of lawsuits back then weren't there?

If you ever get bored, go to http://patft.uspto.gov/netahtml/

Just use Atari as the Assignee, I get ~171 patents and that only
includes the ones invented at Atari vs. licenced.

I don't think that particular lawsuit was about the video chips.
Nintendo used some TI99/4 type derivative made by Yamaha. Something like
a TI9918/28 that went to the next gen and Yamaha numbers assigned.

Atari patented *EVERYTHING*. I mean they even patented using 4 bits of a
JS port to get 8 directions. I think they went after Sega about that one
and won ~$19 million. I aways thought the Nintendo serial JS/Pad was to
get around Atari's patents rather then something someone thought was a
good idea.

Some of the goofiness that went to patent, stuff like: your ship flying
off one side of the screen and reappearing on the other in Astroids. I'm
not sure what happened legalwise when Namco had PacMan run off the
screen and back on the other side. I think either Midway or Atari
patented side scrollers like Scramble.

LOL! It took me until the end of your message before I realized what
you meant by "S.O." Sorry dude none of this compares to S.O troubles.

Regarding CP/M disks, email me. Stephen Sheppard (a t) hotmail...

I tried to follow the ATR8000's SIO connector traces but the connector
shells cover nearly everything. I didn't learn anything significant
there.

The J7 shunts connect to pins 13 and 11 of U54, a 1489 RS-232 driver.

This is a about all I learned so far.

Well having a 1489 in there has to be good news. I'm not sure what you mean about the shunt. Pins 13 and 11 of a 1489 are the input and output of a single inverter.

I'm sure it is something simple, like just TxD and RxD going into the 1489. Probably bypasses the 1489 and just uses Atari Data OUT pin 5 green wire and Atari Data IN pin 3 orange wire not inverted with the 1489 in their place. I'll hunt mine down.

The US market for 8bit Atari software was weak at that time. An
alternative "Diamond OS" did spring up but it never really caught on in
the way Geos did on the C64.

Yes. Of course, you will also get valid opinions that Turbo Basic XL is the best. Both have advantages. I like BXE because it has built-in string arrays. TBXL is nice because of it's available compiler. Although the compiler doesn't produce stand-alone programs, it still rocks. BTW, there is an excellent TBXL cart with built-in compiler available for purchase from Video 61.

Now availability is another matter. BXE is downright hard to find. BXL is almost as good, and is quite a bit easier to find. TBXL is widely available and freeware. If you have a hard drive, then TBXL loads in a flash.

Here's a good resource to find many, many pre-written programs for your use:

http://www.newbreedsoftware.com/xlsearch/search/

This is XL Search -- many times you can find a READY to run program or see what someone else has done to solve a similar poblem.

Not to open up a can of worms or anything, but I would infer from this
statement that BXL and BXE have still NOT been released into the public
domain. Is that correct? I looked through and old thread (sometime last
year) regarding the status various FTe, ICD, and OSS products and the
legalities related to deriving new works from them, but I'm not sure I got
a clear picture on where the OSS cartridge software ends up in the mix.

Hopefully, this can be a simple answer like "No, the OSS carts have never
been released into the public domain."

thanks

Shunt=jumper block. Two at J7 and one at J10(?) to switch to between
Atari and dumb terminal mode.

I saw there are two connections to a single inverter but I didn't
understand why.

I guess I was expecting perhaps Atari Data Out being re-routed to one
inverter and Data In to another.

I was at the trade show in Toronto when Diamond OS was released in Canada. An Atari dealer that I knew at the time picked up a few copies of Diamond OS and a couple of other titles that were released for the ST. I remember one of them being some sex software or something.

When we got back to the shop after the show, a few of the guys that had gone with us to Toronto were checking out some of the software. Of course, being men, one of the first packages that was 'tested' was the sex software. I remember one of the questions that the program asked was, "How many times per week do you masturbate?" Or, something like that. I remember the reaction from everyone when that question popped up. "Okay, that's enough of that," and the software found its place on the shelf.

It was funny. I guess you had to be there. :-)

Count me among those who thought Turbo Basic rocked. I used it almost
exclusively. I especially liked the built-in DOS commands that allowed
you to get a directory from within the interpreter, etc. A nice piece of
work from Frank. :-)

My choices for best Basic interpreters on the Atari platforms are:

Turbo Basic for the 8-bits, and GFA Basic for the ST series. I played with HiSoft Basic a bit on the ST too, but GFA was the best in my opinion. On the 8-bit, I used plain old vanilla Atari Basic until I stumbled upon Turbo Basic, then used Turbo almost exclusively after that.

Hello Steve,

I sent you an email, but just found some info in the original manual/schematics that I have in front of me..

In setting the jumpers for using a dumb terminal, that is, J7 shorts pins 3-5 and 4-6, and J11 shorts pins 2 to 3, that makes the atari cable into an RS-232 interface.

Your atari SIO pin 5 (dark green wire) is connected to the input of a 1489. So this is the line you want to connect to the terminal/pc's transmit line

The atari SIO pin 3 (orange) connects to the output of a 1488, so that line should connect to the terminal/pc's receive line

You also need a ground, which could be pin 6 of the SIO (unshielded wire)

I think that should be enough to get it going as the manual states, "There are no handshake lines for the terminal"

They do mention, set the terminal to 9600 baud, odd parity, 7 bits. Supposedly you fire up the ATR8000, it checks the drives for 3 seconds, you hit <enter>, and it will say "ATRMON#" After that, you're supposed to insert the CP/M disk and hit "B" then <enter> to boot it up.

In looking at the schematic, the "special cable" is no more than 3 lines. So to sum it up, connect -

Atari SIO 5 (dark green) to RS232 pin 2 on a DB-25
Atari SIO 3 (orange) to RS232 pin 3 on a DB-25
Atari SIO 6 (unshielded wire) to RS232 Pin 7

And that should get you talking. Just remember the baud/parity settings and disable hardware handshaking on the terminal/computer.

As for that almighty CP/M disk - that's a rare item!! Definitely make backups of it asap. I'd love to get a copy to mess around with and make an image of the disk so future backups could be made by using a PC. Drop me a mail if you're interested in sharing it. I have two working 64k ATR-8000's, the orig manual on paper as well as the schematics..

Best of luck. I'll try this myself when I get a chance, but I'll be gone for the weekend..

-Kevin

Source record: 5931

I got a free moment, so I tried connecting up an ATR-8000 to a Tandy Model 100 laptop, (only machine I had handy with a db-25), and it worked! I turned it on, hit enter and the prompt showed up. It actually says ATRMON and the # character is on the next line.

Double check to make sure the atari SIO cable colors are right. The cable I grabbed had the orange and dark green reversed from the standard the rest of the cables seems to follow. So in theory my ATR-8000 is all set to boot CP/M (if I actually had a disk)

AFAIK, neither have been released into the public domain. BXL is
easier to find for two reasons: it is generally deemed less desirable
by users and BXL was also available as an orange cart as well as a
black cart.

As far as ADVAN Basic goes, it is a nice implementation, but I
personally always found it cumbersome to use. Perhaps now without copy
protection, it might bear a second look. Certainly the price is right!

I was advised earlier today that my "stand-alone" comment about
compiled Turbo Basic XL programs is not quite true. There are are
evidently add-on programs that link the runtime and the compiled
modules and then allow the compiled program to become an .exe file.
Neat! -Larry

No, Diamond OS was for the Atari 8-bit. The company that published Diamond
OS also published software for the Atari ST. The publisher of Diamond OS
was Reeve Software.

Reeve Software also published the "Sexual Edge"(?) and "News Station" for
the Atari ST computers.

"I compare business to war because each must be approached
in the same manner. It takes strategic planning, good organization, and
total commitment to win. It's not a sport or a game. Every minute, every
hour, you face competition...there are always others much smarter than you.
You have to work harder and serve the customer better to get your share of
the business."
-- Jack Tramiel
-- Founder,Commodore Business Machines

The above is Jack Tramiel's explanation of his "Business is war" philosophy.
The phrase was first publicly coined by Jack during an interview on the
McNeil/Lehrer News Hour in 1983.

Yahoo! (not the portal)

Cool! I'm short on SIO connectors but I think I can rig a bypass for
one of my ugly SIO2PC interfaces.

I never recieved an email from you Kevin, so please try again.

I'm making up copies of my CP/M System disk as I type (well, almost as
I type).

Schematics! Please post them, archive them, and share them! I've
never seen ATR8000 schematics!

I would love to make archival images but I've never found a way to do
it. There are some Teledisk floating around but AFAIK no-one as
produced working disks from the images.

I think I'm barely in time. My SWP Autoterm disk has suffered from some
kind of rot. I only have one backup copy. Though I already had some
working copies of the CP/M system disk, those copies were quite old.

7631. Text mode color?

Newsgroup: comp.sys.atari.8bit
Date: 2006-09-23 12:19:47 UTC

Source record: 5938

Hi,

I have a 130XE. Am I correct in understanding that Graphics mode 0 is the only mode that allows 24x40 text and that text can only be one color? I can only specify a background color, a border color and a single foreground color.

I was hoping to have a couple of foreground colors for text. What I've been reading in couple of places indicates to me that multiple foreground text colors are not possible on any 8-bit Atari including the 130XE. I just want to verify that before I accept it. Sometimes I miss details in the nomenclature.

Thanks,
John

The XL/XE computers have two special text modes, ANTIC 4 and 5, that use
two bits per pixel, so you can have up to four foreground colors. (See
<http://www.atariarchives.org/c2bag/page069.php>.) The tradeoff is that
you lose detail in the characters. If you own a _Joust_ game cartridge,
look at the alphanumerics in that game.

No, the OSS carts have never been released into the public domain.

Mike is usenet aware and I would expect if he ever did release them into
the PD we would be among the first to know.

Just my opinion and I don't have any inside information: I doubt if Mike
would ever release them into the PD. I don't think that he would pursue
anyone just using the files with the emulator either. IMO: The languages
still have some value in the market place.

William Kendrick could probably give you some good info on this since he
has said he is working with Cell Phone programming. There are still
suckers like me who would buy a cell phone if it had a good full speed
Atari 800 emulator on it and if the OSS languages were available for it
I would be willing to pay for an Action! or BASIC XE download too.

I've got two cell phones now, a Noika and a Motorola. Still if there was
a nice ARM micro based cell phone available for ~$200-$300 that let you
run an Atari emulator and most of the apps like games, Texpro, or
Visicalc I would be interested in the package.

What James said.

But if you really want to do it, it can be done either with artifacting
or via display list interupts. That is, you can change the character set
and text color for every line.

All the multi color modes are 20 characters wide. You can mix them into
a GR.0 display via interrupts too.

I've got it. Just had to burn a few brain cells. The 1489 is designed to
not burn up even in a dead short. They do this by having silicon come
in/out through high value resistors. When you short the inverting 1489
stage input to output, you are converting the 1489 from an inverting
amplifier to a pull-up<down?> resistor. i.e.

No jumper
1489
RS232 signal in ->o ttl logic on ATR8000
or out o<-
Jumper
|-/\/\/-5V
TTL signal in ----o------ ttl logic on ATR8000

Interesting but after reading Geezer's post I think I may have lost my
way when trying to follow one of the circuit paths. Geezer likely

knows best. He has an ATR8000 schematic.

Sorry for the mixup!

That sounds reasonable. I have had both the 8-bit and a two STs, but never
heard of Diamond OS. But at least there was a GUI OS for the ST then.

Did the Apple 8-bit last longer than the Atari 8-bit in the US? The Atari
8-bit had kind of a revival period circa 1985-1987 in Europe thanks to
the 130XE selling relatively well.

Actually I think<hope> he may have made a typo. He posted ~shorts pin 3
to 5 which doesn't make sense because pin 5 of a 1489 is something like
Offset Voltage. Ditto for 2-3. See what I am saying? Jumpering 3-5 and
2-3 is the same thing as running a single wire connecting pins 2-3-5.

I think the Apple II series (Apple's 8-bit machines) lasted longer and sold
more units than any other 8-bit machine. I was reading that Commodore
sold in excess of seven million Commodore 64 machines, but I think the
Apple II did even better. Of course, this is just a guess on my part.

I do know that the Commodore 64 was wildly popular especially with home
users. The Apple II had a fairly large installed base of home users, but
was particularly prevalent in schools.

I believe the best selling 8-bit was the zx81 / Timex sinclair 1000
(same machine except internal ram size). Timex sold 1 - 2 million of
the TS1000's in the US alone and Sinclair sold over 1 million overseas.

I believe you're talking about DLI maker, Greg Anderson,
Issue 38, page 19.
I believe somebody 'messed' with the program as printed
in the magazine, thinking they were following good practice
instead of saying X=0, they put in X=Z0 or X=N0, but they
didn't init N0 so the program crashed.
So, I believe you have to put N0=0 , init N0 at the beginning
of the program.
However, I don't think John wants to get into DLIs, but stay
fairly straightforward, in which case, the answer is yes, GR0
uses a single color for background and the letters, just
a different brightness. If you can use big letters, then GR1
and I think GR2 allows four colors for letters. You have
to SETCOLOR and COLOR to set the colors, and then
PRINT #6;"STRING";A$, instead of simple
PRINT "STRING";A$.
Something like that.

Hi Bill!

In terms of CPU, is the Z80 surely the leader ;-)

Otherwise, I would guess the Nintendo System was the best selling. :-|

Kind Regards,

Daniel Mandic

Don't worry Rick! Geezer was talking about shunting (I say shunting
not shorting which always has a bad connotation to me) pins 3 and 5 of
the 6-pin jumper block J7.

One shunt reroutes SIO pin 5 to one input of the 1489 and another Pin 3
to one output of a 1488, if I understood Geezer correctly. Circuits
are definitely not my strong point.

I'll send you the schematics. That would probably be easier for you
(and me).

I am a bit confused here. You cannot get any colors on Gr.0 screens, only change background color and change grayscale intensity. I know these can be different for each scanline, but I did not think you could get colors on the text at all Am I totally forgetting or am I right? Getting too old I guess!

Take Atarian care

The Commodore 64 is the best selling computer from that era by far.
Atari officially dropped support of the 8bits on January 1, 1992 I dont
think Atari cracked a million 8bit sold but I dont know for sure. The
Apple II series ended in 1993 so it technically lasted longer then the
Atari at the end of it's production 2 million Apple II series computers
had been manufactured. Compare these figures with the Commodore 64
which ended prod in 94 and sold in excess of 17 million!!!

Still I'll take a 130xe anyday, but Im biased.

I believe you're right, vidar. For GRAPHICS 0, you get essentially
white or black letters on 16 colors of background.
You're not going to get yellow, then green then red letters, like in ANSI
or, maybe HTML. I don't think that is possible even with
DLIs. There is some possible change of color on a single line
of text, using special timing, but that is pretty advanced.
I remember Moriarty's 'Crash Dive' in about ANALOG 18.
it had two colors background on a single line where you typed
in your instructions. I'm not sure how he did that.

7647. Atari 800 - keyboard inop after long storage - the answer

Newsgroup: comp.sys.atari.8bit
Date: 2006-09-24 04:34:18 UTC

Source record: 5804

It was the keyboard.

I ended up buying a couple of old 800s from a guy for parts and swapped in the keyboard from one of them. That solved it. Everything is fine now. Plus the purchase included 300-400 old Atari game diskettes. I can see my old case of Atari thumb coming back at age 58! Thanks for everyone's suggestions.

The Timex Sinclair? At the 1987 Comdex show, Commodore announced that they had shipped seven million Commodore 64 computers. And, Commodore 64 machines were still selling well into the early nineties.

Heh, I don't imagine anybody at Commodore ever stood at the podium and
received a marketing excellence award from the Chamber of Commerce, but
when you have the numbers, you don't need awards. lol

I think it's not too difficult, as you say, timing. There's a register that syncs each line, so if you do that and not too much else, I think it's not a problem. You cannot put the different colors where ever you want, I think it's timing will put the change about half way over screen. There you can NOP to move it a little bit further I think. I tried this a long time ago, think it was stable, but had to stop the keyboard interrupts, to avoid the glicks.

Source record: 5807

Yep, I am talking about shorting/shunting the jumper pin numbers and not the pins of the 1488/1489.. One thing that concerns me though - when you put the ATR-8000 into RS-232 mode, you make it possible for pin 3 on the SIO bus to be out of the 0-5 volt range, so if you did go and connect an atari back up, you could damage the atari. I'm looking at an 800XL schematic here and that line 3 goes into the 800XL, has a bypass capacitor to ground, and then through a 100 ohm resistor to the Pokey chip. I'm not sure what kind of abuse the pokey can take, but it would suck to smoke or partially ruin your pokey. So if you are messing with the jumpers, make sure they're back to normal before using the atari.

(In reality, I'm sure I've tried messing with the jumpers without RTFM'ing years ago and never lost a pokey, but still, try and be careful because pokeys don't grow on trees anymore :)

-Kevin

> the only mode that allows 24x40 text and that text can only be one
> color? I can only specify a background color, a border color and a
> single foreground color.

I agree with the people who answered that the text is always the same
colour as the background, but with a different intensity.

Also, you can use players and missiles ("sprites") to add a colour
pattern to your text screen.

You've got player 0, 1, 2 and 3. Each is 8 pixels wide. Set the players
to the widest mode. One player pixel is then as wide as a 24 x 40
text character. So the four players can be used to add colour to
32 out of the 40 characters on a line of text. Then there's missiles, and
unfortunately I cannot recall if they are 1 or 2 pixels horizontally. If
they are two pixels, you can use them to add colour to all 40
text characters.

There are limitations to what I have written above.

One limitation is each player has only one colour.

Another limitation is that at least one of the players/missiles has
a strange way of mixing with the background or the foreground. I
noticed this while writing a text adventure with character based
graphics. You know, the special characters that look like squares,
triangles, half filled squares, lines, hearts and et cetera. It is
absolutely possible to create interesting effects with the 24 x 40
text mode and player/missile graphics.

Finally, isn't it irritating that a computer that is in some respects
is ahead of the 8-bit generation, almost a mini Amiga, cannot
produce multi colour text?

Anders

Isn't the 800 the greatest of the Atari 8-bit line of home
computers? It looks super cool. It is so 1980. Sometimes I
plan on dedicating a room in our house to the year
1980. An interior in yellow, brown and wood. A telephone
from that year. Maybe a Star Wars movie poster on the
wall. And, an Atari 800.

He had it correct for what he wanted, which was display the little pine tree
from a program statement. The <esc> <ctrl-up> sequence puts the up character
in a program line, but then it only moves the cursor when printed. In order
to display the little tree, you need an escape character in the print string
before the ctrl-up; something like:
<quote> <esc> <esc> <esc> <ctrl-up> <quote>

Here in the midwest US apple did better then atari, and commodore C64
wiped the floor with both of them on number of sales before it was all
over for the 8 bit market and the smoke had cleared.

I was one of the few atari people in the area, always an outcast :)

CPU sales, that would be hard to track.. But i bet you are right since
there were so many machines that had the z80. (unless you count the
8088 as 8bit.. it was, sort of)

I still do think the C64 outsold any other 8 bit machine here in the US.
bunches and bunches were sold.. i heard something like 10 million?

The error in DLIMAKER was on line 160.
Need to change:
160 DNUM=DNUM+Z
to
160 DNUM=DNUM+K1
Also, in the resulting DLI file that is created, you have to
init K1=1, GOSUB 11000, GOSUB 10000.

Uh, how can you say that something is "NEW" and has "NEVER" been "USED" when
you say in the same sentence that the thing is flaky and has a bad power
cord. Obviously, the monitor is _not_ "NEW" and _has been_ "USED"!

hehe, don't you mean "always a rebel"? You're only an outcast if you have a
desire to belong to the group. They can't very well cast you out, if you
want nothing to do with them. Right?

Ya gotta remember that you _chose_ Atari! The Commodore and Apple people
didn't reject you; you rejected them. :-)

I would have to think that the 6502 processor was the best selling 8-bit
processor. They were in Commodore computers, Atari Computers, Apple
computers... The 6502 _owned_ 8-bit computing.

Very true. The Guiness Book of World Records lists the Commodore
64 as the best-selling home computer of all time (though it says
Commodore sold 30 million of the machines. The book probably lumped all
the various Commodore models along with the C64).

This is all o.k., but Nintendo is still selling. So I placed it on the first place. Not to mention the moneyearning-difference in sold games, between a nintendo and the c64.

The 88 is also a good point, as you could say it is one of the predecessor of today PC's. At least, my i686 (P3-S) can drive software from all intel-compatible times :). With a DOS Windows combination, seperately of course. And it is not so old... the CPU came out, about 2000.
Even a basic-listing (~1979-81) with numbering 10, 20, 30 etc.. appeared on the monitor :-), in 320x200. DOS, of course.

I like it.... ;-), but older games are not so good on PC as you can find smoother and better versions, on other calculators. e.g. Monkey Island, SSI RPG-series.
Some later DOS Games are fine! Warcraft II, Settler II for example

Best Regards,

Daniel Mandic

He said that the monitor turns on and off. The only way to know that the monitor turns on and off is to use it. Therefore, his claim that the monitor is "NEW" and that it has "NEVER" been "USED" is false.

And why should you accept the word of someone that is clearly lying about the items he/she is attempting to sell. If he/she is lying about this, how can we know that he/she is not lying about anything else?

The poster wasn't trying to mislead (lying). He was trying to
be descriptive. There is a slight problem with the monitor and
he's trying to point it out. The monitor was probably in storage
and got a loose power cord damage in storage. Just plugging it
in and seeing that it has a raster isn't USED, I would say it
was never used in an ST setup, just tested because of the loose
power cord. Any prospective buyer can expect a clean
monitor with a loose power cord, that's all. I can't remember
if a SC1224 has a fixed power cord or a jack and removable
cord like most VGA monitors and desktop computers.

In this circumstance, selling old, but unused stuff, I would
want the item checked out. The more checking the better.
For a monitor, I'd want it plugged into an computer and
see that it comes up with the desktop. For the Indus drives,
I'd want them hooked into an 8-bit and at least booted
from floppy, if not run a thorough 720 sector read/write
and format, all button checked. Even if they've never been
out of the box, I'd prefer them checked out.

IMHO, thats a sorry argument. What monitor, new from the factory, was
never turned on, even during testing??? When he says "never been used" its
pretty clear he means by an end-user. Not to put you down, but really, it
shouldn't take a rocket scientist to figure that one out. :)

I know Charles. He's a fellow Atari SysOp. I'd take him at his word. This
"jackpot" he received was from a former Atari dealer. You might want to
think about that for a moment before you slam him.

> > --

An additional way to accomplish what you want is to Poke 766,1 which will turn off the interpreting of characters control codes and simply print them (making it unnecessary to use <Esc> at all before each of them). You would Poke 766,0 to return things to normal afterwards.

It would look like this: POKE 766,1:? "<Ctrl+Up>":POKE 766,0 .

The one side effect of this method would be that no other control codes that are printed will be interpreted while location 766=1 (the one used most often is the clear screen character).

Yet another way to accomplish the same thing would be to place the character codes into screen memory directly (though this requires translating them to that format), I mention this last method only for completeness, knowing that this is something you would probably never want to do for your purposes.

Thats true, until you also start including smart terminals and imports
from japan. the Z80 was king over there. So you would get all these
Epsons, Sonys, etc coming over to the US. Remember, most every cpm
machine had a Z80 in it somewhere and there were lots of those.

Dont forget too that Tandy pumped out tons and tons of Z80 machines. (
oh and Sinclair.)

Perhaps its time to find out total numbers of production on various
machines ? Just out of curiosity, as it really doesnt *mean* a hell of a
lot at this stage....

Here in my collection of about 30 8bit machines its pretty much a wash
between 65xx and Z80. Couple of 68xx.

The assumption was that he _was_ an end user. The assumption was that he
had used it... even if he had only used it for testing, the claim that
the monitor was "never used" is rendered false.

My comments were _not_ meant as a slam of Charles, merely as an observation
on the seemingly inaccurate information offered by Charles. It would not
have taken much to say, "this machine has only been used for testing."

There's a lot to be said for clarity of description... Most obvious, is
that prospective buyers know exactly what they're getting, and are not
scared off by seemingly contradictory descriptions.

I can appreciate that you personally know Charles and can vouch for his
honesty and integrity, but common sense would dictate that most people do
not know Charles. More to the point, most people's only impression of
Charles' integrity is derived solely from his ad -- which I'm sure you'll
agree, was not exactly clear, and left much room for doubt.

My grade eight teacher used to say, "say what you mean, and mean what you say." It just makes it easier for other people to understand exactly what you mean.

I'm not trying to be an ass here, but I've noticed that those who have come to the defense of Charles, have greater knowledge of him and his items then the rest of us do. For example, Ron Hall stated that this stuff had come from an old Atari dealer. The rest of us didn't know this because it is not mentioned in the ad.

Being clear in your description is also very easy. And it goes a long way in eliminating questions from those who are not able to read minds, or have no personal knowledge of the seller and/or his goods. I fail to see how anyone can honestly say that his ad was clear; it was not.

Say what you mean. Too easy. :p

> cord like most VGA monitors and desktop computers.

You're making assumptions for which you have no basis on which to do so.
The seller was not very descriptive. The fact that you and I both jumped
to conclusions is a testament to this fact.

You state that the monitor was "probably in storage and got a loose power
cord damage in storage." You do not know this for fact, and the seller
offers no information that this could or would be the case. Likewise, the
seller offered descriptive information that was quite clearly
contradictory. My assumption is no more incorrect than yours is; both
were based on incomplete information.

In a court of law, by the way, your argument would have raised an objection
from the opposing party. My line of thought would have been construed as
proper discourse. As such, perhaps I've just become far more cynical in
my old age, and justifiably so, I might add.

And the gameboys had a stripped down Z80.. so even in 2006 there are
still lots of z80s out there.

I never did games, so that part of the retro thing never has done much
for me. I was one of the boring types.

The Atari 2600 used the 6507 processor, which was a stripped down 6502. The 6502 was the cheapest 8-bit processor available when it was introduced and was used in Atari, Apple, and Commodore computers. The Commodore 128 used both the 6502 and the Z80 processor.

The high end 680x0 based Macintosh computers (Quadra 900 and 950) of the early nineties also used the 6502 processors as IOPs. I believe these machines shipped with two 6502 processors on the motherboard -- or logic board in Apple speak.

The 6502 processor, which was created by MOS Technologies, was also manufactured by Rockwell and Synertek. In later years, the 6502 design was licensed to several other companies.

Some of the companies that used 6502 processors as the core of their computer designs include: Acorn, Apple, Atari, Commodore, Compukit, Franklin, MOS Technologies (Yes, they also produced an 8-bit computer), Ohio Scientific, Oric/Tangerine, and Video Technologies.

Some universities still use the 6502 processor to teach assembly language and computer architecture. These universities include the University of Tasmania, Hull University, and the University of Applied Sciences in Germany, among others.

6502 processors are still used in embedded architectures and are still widely available. In addition, there were several 16-bit processors created that were based on the 6502. These include the 65802 and 65816 among others.

Whether there were more 6502 processors produced and sold than the Z80 processor, I do not know. Do you?

Found in Google Groups:

From: Alan Reeve - view profile
Date: Fri, Sep 24 1999 12:00 am

As of the past week we've starting receiving email asking where
Diamond GOS can be obtained. It's not advertisied on our web page at
www.reevesoft.com so you can probably guess that we don't have any :)
If we had them we'd want to sell them.
Diamond GOS supply was all sold back in 1990 and ICD informed us
that they would no longed be producing SuperCarts for us to use so we
could place one last order and beyond that never see them again.
That's why so few were made (I think the count is around a thousand
encompassing all versions).
We have since released the 64K PROM and encouraged emulator
developers to emulate it providing technical assistance to one
gentleman who expressed an interest and sounded like he was making
good progress. Source code will not be released and made freely
available for many reasons which I'm not going to go into.
In any event, the ROM was released and everyone is free to have a
copy provided that there's no commercial gain from it. We, however,
are not going to be posting it every two weeks and take on the role of
supplier nor can we keep answering Atari 8-bit oriented emails asking
if we have any to sell.
- Thanks, Alan

I remember a game I only tried once. I believe it was
"Track and Field", you had to jag the joystick back and forth
to control the legs, and maybe a fire button to jump. It only
took a few minutes to detroy your hand with cramps.
I finished 'Crash Dive' again, it was one of the first programs
I typed in from ANALOG. Moriarty went on to write for
INFOCOM, the premier for text adventures.
but I digress.

Here's some more information about the 6502. The 6502 was the same chip as the previous 6501, which it replaced, albeit with a different pin assignment. The 6501 was created by MOS Technologies to be a cheaper replacement for the Motorola 6800.

By using a simpler design, MOS Technologies was able to create a processor that was pin compatible with the Motorola 6800, and ran somewhat faster. Motorola immediately launched a lawsuit and production of the 6501 processor was halted. MOS Technologies reassigned the pins of the 6501 and released the 6501 as the 6502 processor. This, apparently, was enough to appease the legal department of Motorola.

As previously mentioned in another post, there were several different versions of the 6502 processor released under names like the 6503 and 6507 processors. The 6507, also as previously mentioned, were used in the Atari 2600 video game consoles as well as Atari branded disk drives.

Listen Pal. I NEVER sell a item that I cannot verify works. Why in the world
would anyone screw someone like that. I opened it up tried out every item so
no one buys it and gets a suprise thats its not working. By you thought,
every tv you buy at the store is used because they had to turn it on to make
sure it works, and every car they make is used because they had to drive it
to the carrier to load it up. Come on man. WTF

Going through life trying to find the flaws in everything, as in my choice
of words to describe my products was a huge waste of time, and brain power.
If you wanted to be smart, you could have just started asking question about
what I was selling. Instead you started picking apart what I said. To me
this is a horible use to time and brain power.

To all. Well I have sold the 2 indust drives, to someone already. I have
also sold the older Sc1124 monitor, and the mono monitor. Also the Atr8000.
I still have the used 1040, 520, and the NEW YES NEW color monitor that what
seems to be a messed up power connector. If no one wants it I am going to
just fix it myself, and use it.

Like I said to Ron Hall, I don't know you and your post was not very clear. As for your question, I don't know why people would screw other people over like that -- I just know that they do. I apologize for thinking that you may have been one of those people.

And I don't mean to nitpick, but you're getting a little bit carried away with your analogies. Firstly, you're comparing your post in a newsgroup to that of a legitimate business with a storefront. I think you're smart enough to understand the difference between doing business with a stranger on the Internet, and doing business with a reputable automobile manufacturer or retailer in your hometown.

I'm not saying that you're not a reputable business or person, I'm just saying that I'm not aware of your reputation. And, that's really the whole point.

I agree, this is a waste of time and brain power. And it wasn't your choice of words that I was questioning. It was your lack of words. To be more precise, your incomplete descriptions of what you were selling.

Like I said previously, if I were Ron Hall, and I knew you as a fellow BBS operator, and I knew that you had picked up these items from a former Atari dealer, then I wouldn't have questioned you at all. I'm sure you're reasonable enough to understand this. I don't believe you're a stupid man.

Hi ziggy!

I still enjoy a game on MAME. Games I have played as a child.

z80only :). There are some 68k arcade, but I like the Z80 arcade at
most. It's the best game play.
256 steps are sometimes more exact than 65536 ;). Today TFT-viewer say
the same about... less is more :-)))

Kind Regards,

Daniel Mandic

LP has been, and continues to be, one of the most significant contributors
to the Atari community. Especially on the ST side (MINT and GFA Basic).
Perhaps you should check out his website sometime?

Oh, BTW, for some reason, I can't remember...what is it that you've done
for the Atari community? Thanks... :)

Do car dealers, TV dealers, computer sales people do that? Do they have
to? Isn't it understood that somewhere along the line, even a brand
spankin new, from the factory item, has been used at least once? How many
actually say, "This machine has only been used for testing"? I don't
believe I've personally ever seen that on anything I've bought.

C'mon Albaclause, you're defending a really bad position here.

Not that I feel I have any obligation to the Atari community, but I've done very little for the Atari community of late. You know, things like life get in the way. But, I did run a chat server for a while a year or so ago. I created the disk based catalog for a Public Domain software vendor at one time. I was working on a public domain software archive for the Atari 8-bit community. Oh, and of course, I contribute to this newsgroup from time to time... I answered some of your queries regarding your ST and UDS-10, I answered another person's query about his non-working Atari 800, and so on and so forth.

Granted, I haven't been unloading a bunch of Atari merchandise to my fellow Atarians. But I believe you asked about contributions -- not profiteering. :-)

I was going to stay out of this, and I intend this to be my only post on the subject, but I just wanted to make sure it is well known that Chuck is doing anything BUT profiteering on this stuff. That might not even be what you were implying, in which case you should feel free to disregard the rest of this post.

As one of the people fortunate enough to have made a deal with Chuck since the initial post of this thread (that's what I did while the flame war ignited), I can assure you it has thus far been one of the better dealings I have had in obtaining equipment - and that's saying a lot given the number of great people I have deal with around here. We spoke on the phone, I was sent a plethora of photos, the stuff is in great shape, and the savings have been passed on to the people who can use the hardware.

Not to brew up the flames any further, but as long as I'm here... :) In my opinion, the initial post is actually exactly what I like to see. To me, "new and working" always implies that the stuff in question hasn't been fired up except for testing in order to avoid making someone a bad deal. Of course, Ron's endorsement didn't hurt in convincing me that I should get dibs on the items I was interested in.

I think I read them with the same meaning, which is probably why I
misquoted it. At any rate, your other reply is enough to end my
contribution on the topic. BS is a subject I'll stay out of entirely.

Not that I really want to continue on this subject, but I agree with you
that "new and working" is much better than "NEW NEVER USED". And who could
blame you for giving credit to Ron Hall's endorsement? After all, Ron is
a known quantity in these parts. Do ya see what I'm saying?

Chuck B wrote:

> Someone is crabby!! and has a horrible life

Yeah, I do have my crabby days. But they're justified in my opinion.

I don't really want to stray too far off topic, but my life has been really horrible for the last several years. Mostly because my life hasn't been "my life". Apparently there's this piece of garbage that thinks he/she owns my life. Hence my signature.

This has to end immediately. I am not interested in anything that I don't pursue on my own. I have my own mind, my own interests, my own style, and my own objectives. If none of these are consistent with what he/she expects of me -- too f'ing bad. I'm not in the approval business. I seek no ones approval and I really don't care what people think of me or how many people I have to hurt in order to get what I'm after. And make no mistake, what I'm after in no way resembles the female form. I personally despise females and I will make absolutely no apologies for this. And you can feel absolutely free to disseminate this message -- cuz the more women that know of my disdain for them, the better. I will be a much happier camper when I am secure in the knowledge that I will never have to be burdened with the company of a woman. :-p

I apologize for the rant. This is not directed at you Chuck, and please don't feel that it is. For the people that it is directed at, however... I'm ready to destroy you. And it's been a long time coming... and you can be damn sure that you totally deserve it. kiss my mo'f'ing ass!

Not profiteering. You're making (bad) assumptions again. He got this stuff
from a former Atari dealer at a low price, and is passing that on to the
people he's selling to.

Sounds like a pretty noble endeavor to me...

Incidently, these figures look somewhat suspect to me -- for instance,
look at the Atari figures that show that ZERO 400/800 units were sold
from 1986 on. I would guess that the XL/XE machines were lumped in
with the ST's from 86 on. I've read sooo many different *published*
estimates of how many machines were sold of various types.

Incidently, the text article (link) that is embedded in the stats. page
is quite interesting, also.

Ben Heckendorn finished that project last year. He has a very nice
article showing how it was done on his website,
http://www.benheck.com/.

I see Ben's been at it again. This time turning an Xbox 360 into a
laptop.

Ben has been most well known for turning game consoles into handhelds.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

I went to their warehouse sale when they unloaded most of the junk still
sitting around in the labs and I never saw anything that went that way.
Most of the stuff was 1450XL kind of bigger and better except for one
prototype called "Patty" IIRC that looked like the precursor to the 600XL.

Atari was slaved to the silicon. They would have needed to convert all
those custom chips to CMOS and they lacked the will at the time.

Atari Corp. showed the 65XEP at the January 1985 CES in Las Vegas, as part
of their initial introductions of both the XE and ST series of computers.

Okay now I rem. Did any ever make into the wild? A portable 8bit
would of been cool. If they had been able to follow thru with the
Flashback 3 we would of got a enchanced 8bit on one chip and someone
would of made a laptop out of it.

It's my favourite. Normally I do not numbering my favourites.... but
M.U.L.E is an exception. -First Place (so far)

I thought I know much about but/and I still explore new programming
skills, yet, programmed into this all time Favourite. But it is so
small in KB :)

Long live the 400/800 and their developers!

Best Regards,

Daniel Mandic

I would have to disagree.

Atari was biggest around and just before 1982. Then a recession hit, and hit kinda hard. I was very young then and didn't know what that was about however, I just remember one important detail about the whole thing..... there was no place to buy Atari products. Believe me, I would have if I could find a place, but one after the other, all the places just shut down.

A good saying once was, "buck the recession". In other words, you spend money. But the argument also goes, not only do you need money to spend, but just as importantly, you need a place to spend it.

Atari made a few really nasty mistakes.....

1. Ray Dumbass, CEO at the time, fired almost the entire engineer staff all at once, calling them a bunch of prima donnas. So some of them decided to start Activision, one of their biggest competitors. A move that hurt Atari but was also very well deserved. Activision became a very good company with very good games at lower prices. They also knew how to treat their engineers.
2. Some idiot in Atari decided to move their factory overseas, all at once, without testing the idea, just before Christmas sales. It was delayed, Atari fell hard.
3. There were an AWFUL lot of very good programmers that were MORE than willing to program some wonderful programs for just a little royalty. I think that some VERY VERY good talent could have been tapped for some VERY VERY good programs and games with a little pro-marketing, even in the 1982 recession. Perhaps if Atari had partnered with ANTIC and put out a good software catalog, with reviews and information, opening a little door for people to not only buy but also to sell their programs.

And, #4. I was very disappointed when Atari quit supporting their machines. At the time, mine was an Atari 800 and a little later an XL. They just dropped it all together and the only support were Atari Computer Clubs and the such like. IBM Compatible machines stayed around because they were always backward compatible (to a point) and thus it lived on. All I know is that I didn't want to purchase another machine that would end up 'unsupported'. Even if only my idea #3 had been implemented, it would have still been a form of support.

Hi Samsung!

And this is all still hanging on to you? Can you not forgive the happenings, actually closed, payed and forgotten.

They (ATARI) would not like to have it the other way.

Your computer would be no computer. Foreseeing all is not possible.

Now let's go to past perfect tense and forget about all tis stuf. I am still amazed about the amerikan movies of the later seventies, how big their towns, how big the cars and how small some livingrooms (slums!?), and how this can work economically. But the music, often used in such films, is outstanding (Calahan, Dirty Harry -for example)

Best Regards,

Daniel Mandic

It worked! Pretty easy too. I just popped the MAX233 chip out of one
of my SIO2PC cables and made a couple of quick jumpers to let send and
receive pass straight thru.

Perhaps later I'll rig some switches but for now this will work.

The jumpers inside the ATR8000 aren't exactly convenient but I don't
think I'lll be changing modes very often.

Antique Comptuer Swapmeet - Wilm, DEL October 7th 2006
Pass it on!

Midatlantic Retro Computing Hobbyists Present:

The Wilmington Classic Computing Show and SwapMeet
DATE: October 7
WHERE:
504 N. Market Street
2nd floor / Copeland Room
Wilmington, Delaware 19801

LOAD IN: 8AM
EVENT STARTS: 10AM
AUCTION: 2:30PM
EVENT ENDS: 4PM

PUBLIC ADMISSION: $5.00 ($7.00 per family)
RESERVED BOOTH: $15 ($10 MARCH members)

2800 square feet of hard-to-find "classic" computers (pre-internet
age), gaming, test equipment, parts and supplies, software, and more
for sale, swap, and auction.

Sell or trade your pre-1990 computers!

Supports non-profit group dedicated to the preservation of historical
computers.

While everything you said is more accurate then debatable, it would not have made a difference.

You only have to look at a list of what computers were available and who was in the business. I can think of literally a dozen brands like Coleco, Eagle, Ti 99/4, Timex, etcetera. There were even odd ball ones like Bluebird.

As was said in the movie Meatballs "It doesn't really matter."

Not all those computer manufacturers had Ray Kassar as the CEO.

Truth be said, it didn't really matter. Everyone went down to the MS/IBM juggernaut.

It's a lesson in market demographics. IBM got into the work place => educated, employeed, intelligent, well paid. Once they got that demographic the children of them logically followed for games. Apple had a good idea getting into the educational market figuring they would buy Apple when they grew up or nag their parents into buying Apple, but it ended up not being the winning strategy.

What was left after that all the other players? The what they had established previously, the uneducated, the unemployeed, dull, broke. Hard to survive in that type of market.

IBM didn't win. It was the clones that won. The modular,
updatable design with dozens of manufacturers for portions
of the clone, hard drives, modems, monitors, keyboards,
floppy drives, BIOSes. The IBM clone was considered
'as good as' an IBM (100% compatible was the point).
Oh, and parallel centronics printers. All the other computers
tried to monopolize on peripherals, the DEC rainbow even
tried to prevent 'standard' floppies, you weren't supposed
to be able to format a floppy. The IBM Jr. was a disaster.
The IBM compatible clone was the cheapest way to do
computing, and MS made there DOS freely copyable.
MS made most of their money from clone manufacturers.
Even today, the PC is cheaper than a MAC. And MS

did a great job of keeping the DOS/OS compatible so
you didn't have to buy new software every time you got
a new computer. Even today, or maybe recently, MS Office
was freely copyable.

Cross-posted to: pdx.forsale,comp.sys.atari.8bit,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace

Video monitors for your classic game system.
Commodore 1701
Commodore 1702
Both in excellent condition.
Used rarely with a VCR as a super-resolution TV...
So there are no screen burns from continued game use.
No box or cables, but way cheaper than dealer price.
Pick up only in Tigard, Oregon. CANNOT ship.

Have one each. When they're gone you'll be back to
paying dealer prices.
$50 each.
Thanks, mike
return address is valid

7736. What is your favorite 8bit game of all time?

Not the best 8bit game but the one you still play and enjoy, your favorite.

Mine is Donkey Kong, this is the best port ever and I prefer it's random no matter how good you are you can still die in early stages if the monkey throws a certain pattern of barrels gameplay to even the arcade version.

Kevin

7739. atari++ 1.50 released

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-02 09:27:32 UTC
From: Thomas Richter <thor@math.TU-Berlin.DE>
Message-ID: <4oc4c4FdnuoiU1@news.dfncis.de>
Source record: 5746

Hi folks,

a new release of the Unix/Win32 atari emulator is available for download
at

http://www.math.tu-berlin.de/~thor/atari++/

Credits for this release go to:

- Sebastian Pachuta (again!) for pointing me at some bugs in the player
missile timing logic. It is still not perfect, but much closer than
before.

- Bennet (beipdev@yahoo.com) for providing me with very detailed
information about the antic DMA timing that got incoprorated into the
1.50 release.

What's new this time: Aparently a lot, thus a new tenth digit in the
release counting:

Atari++ 1.50
- This release is mainly a bug-fix release that addresses
a couple of issues especially on 64 bit systems:
- Fixed various erraneous varargs usages, mainly active during
error handling, that caused crashes on AMD64 systems.
- Fixed reference to the linux joystick device. Newer kernels
place this device at /dev/input/jsx instead of /dev/jsx,fixed.
- The H: device handler wildcard matcher now also finds files
whose extender consists of blanks.
- The joystick handler contains now a workaround against
some faulty implementations of the emu10k1 (SoundBlaster)
gameport interface and got basically self-calibrating by
using the second unused joystick axis.
- The DMA timing got reworked heavily. Thanks for that goes to
Bennet (beipdev@yahoo.com) for providing me with more detailed
information.
- The way how horizontal timing is organized changed
heavily, and the timing constants for ANTIC and GTIA changed.
Thus, new items in the menu will adjust the timing, and
old ones got removed.
- The player/missile generator changed a bit and is now aware of
some internal GTIA reaction times. Thanks for providing examples
for this goes to Sebastian Pachuta (thanks again!)
- Some heavy bugs got fixed in the X11 interface that could have
caused conflicts with at least some window managers because it
re-opened windows to fast. These problems are now avoided by

using a more careful logic.
- An out-of-bounds memory write in the mathpack emulation got fixed.
- Error handling in the complete menu and error requesters
itself got improved.
- Errors from the X11 subsystem are now captured and reported in
a more user-friendly way.
- The complete user menu creates now string-gadgets for numeric
values whose numeric range is too large to be fine-tunable by
a slider alone.
- Improved the speed of the X11 true-color output by enlarging
the output/color buffer.

And, hopefully, the file server of the TU will make it for a couple of
days, this time... (-;

So long,
Thomas

7740. Looking to acquire SIO2IDE

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-02 11:11:44 UTC
From: David Bowden <nospam@spamsux.org>
Message-ID: <y9udnR9WmqJ0br3YnZ2dnUVZ_q2dnZ2d@comcast.com>
Source record: 5747

I'm interested in getting me an SIO2IDE interface, but I am unable to email
the creator/owner of this site: http://atariarea.histeria.pl/sio2ide/

to ask about one. I don't know if the address is valid or not, but my ISP
rejects the email address marek_mikolajewski@NOSPAM.wp.pl (minus the
"NOSPAM", of course).
Does anyone here know of another source for an sio2ide?

Thanks,
David Bowden

7741. Looking for SpartaDos high speed SIO APE/Atarisio/SIO2PC driver

>

Check out this thread at ATARIMAX. HiassofT has written a patch to the MyIDE OS that automatically detects high speed devices and uses the appropriate driver. It should work with 3.3a.

The first game I was really hooked on was probably Asteroids for the 2600,
but I must say, Star Raiders on the Atari 8-bit is solid gold. And Rescue on
Fractalus, Ballblazer, Bounty Bob Strikes Back rocks too!

I explored some games with 8080 chip... hmmm, the 6502 can be find up
to 1982. I know, it is programmed and merchandised longer, but the 8080
vanished in that time more and more, with over 2MHz. The 6502 Games in
82', for example, still had KHz, or two 6502, both under MHz.
Vanguard for example....

By the way, what and who is 8080?

> I still do think the C64 outsold any other 8 bit machine here in the
> US. bunches and bunches were sold.. i heard something like 10
> million?

Maybe.... the best sold HC, if you look from the merchandise-side.

And country !?, because I think Japan never had the c64 in big aomounts.
They had floppy-mode 3 at that time and other systems I never saw, but
knowing them now (information, and from emulators) as intelligent
systems, IMHO.

Z80 driven machines (e.g. arcade and some higher tacted Z80 PC's), I
saw up to the late nineties and today. 'Cannon Ball' (Sung/Soft Vision)
for
example 1995. Some of the arcade Z80 were combined with a 68000 or
68EC020...

Best regards,

Daniel Mandic

I'd have to say M.U.L.E. I've played that more than any other computer game. A close second would be the Ultima series.

My favorite non-8-bit game would be DOOM.

My first place ATARI VCS Game is Superman and Berzerk (I have coloured paintings on the TV-tube, for additional walls, and in some other games, like 'Tank', too.) I haven't with Superman, but my brothers record of 56, or so, is unbreakable by me. Also Tic Tac Toe, he could beat any grade of difficult (1....9 !?).

My favourite non-8bit (let's say Atari ST 32bit/16bit), is (hehe...:)) 'Fate Gates of Dawn'. REline Software.

Kind Regards,

Daniel Mandic

Hi David,

I don't have an immediate answer.

I recall from some chat sessions that Beetle at
www.Atariage.com/forums/ has a friend, mega-hz, who has or makes (not
sure which) the PCBs and can assemble complete units of SIO2IDE. I
don't know if kits are available. Mega-hz only has the older 3.x model
of SIO2IDE, the model without the USB connector.

Beetle and mega-hz can also be contacted at www.abbuc.de forums. The
site is German/English but the forum posts are mostly in German.

mega-hz has website but last time I looked there were no references to
SIO2IDE.

Yeah, the Ultima series rocks! First RPG I ever played was Exodus on my
800XL. Man, what great memories. :)

Um, maybe I'm just confused by the way you worded that, but Commodore's 6502
ran at a flat 1Mhz, and the Atari was a blazing 1.79 Mhz, starting at day
one, from the 800 all the way through the XEGS, some 13 years later.

>
> By the way, what and who is 8080?

The 8080 CPU? That was Intel, and it was the "successor" of the 8008, the
great great great GREAT (probably could throw in a few more greats just for
the hell of it...) grandfather of the modern line of Intel CPUs.

I meant the 6502 does much more than a 8080, and that with lower
frequency!

Yes, nearly a MHz for the C64. But also good performance compared to
the freq.

(Why 6502 and C64? Is it not the 6510?)

In no particular order, and with some slight of hand by combining more than one into a single line, my top ten are:

1. Jumpman & Jumpman Jr.
2. Blue Max
3. Boulderdash 1 & 2
4. Archon
5. Beachhead 2
6. Ultima 1 - 4
7. Drelbs
8. Alternate Reality (the Dungeon)
9. Great American Road Race
10. Star Raiders 2

There are many more of course, but these are near the top.

From: Sellam Ismail <sellam(at)vintagetech.com>

In case you've been too busy to notice, VCF 9.0 is only a month away!
The ninth annual Vintage Computer Festival happens on November 4-5 at
the Computer History Museum in Mountain View, California.

[snip]

This year's event is going to be especially keen, with an already
excellent line-up of speakers (and still more being added) and the
inauguration of two new features: our Build-It-Yourself Workshops and the
Vintage Computer Film Festival, featuring documentaries and films covering
vintage computing and technology themes. And there's so much more!

With our 30th year anniversary celebration of Apple Computer featuring
Woz along with a bevy of early Apple employees and founders, a reprise
of the Sol-20 reunion at the first VCF with Lee Felsenstein and the
prototype Sol-20, and our new Vintage Computer Film Festival, we're
expecting a rather large turnout with plenty of media attention to
boot.

[snip]

We've dropped the registration fee for exhibitors, yet as an exhibitor
you're still entitled to full access to the VCF, because exhibitors
are VCF VIPs. So mark your calendar, dust off your favorite old
computer, and get ready for a nerdily fun weekend!

Go here to register:

http://www.vintage.org/2006/main/exhibit.php

[snip]

Best regards,

Sellam Ismail
Producer
Vintage Computer Festival

Here are the one I regulary play

-Mule
-Archon (I and II)
-Kennedy Approach

Just for the little story, I've discovered computer when I (well..my parents !) bought my very first computer, an Atari800XL. I bought with it a package game. I don't remember the title but it was an olympic game for one (I found an ATR file of this game and title is "track and field" but I'm not sure it was this title used when I got it in France in 1988). Well, I played this game hours and hours !

Now I live in Mexico and my atari stayed in France but thanks to Atari800win Plus, I still enjoy my 8 bit.

Or you can always ask me for a copy at mailto:hunmanik@earthlink.net

UPDATES SINCE PREVIOUS POSTING:
2006.10.04 BAKTRA, TURGEN SYSTEM 3, mmSAP 1.3
2006.10.04 Thomas Richter, atari++ 1.50
2006.10.04 Radek Sterba, ATADIM v2.05 Beta
2006.09.28 Mark Grebe, Atari800MacX 3.4.2
2006.09.25 Odsiecz Sobieskiego, xunzip v2.1
2006.09.25 More Than Games, 6' Svideo cable, 12' Svideo cable
2006.09.21 Mark Grebe, Atari800MacX 3.4
2006.09.18 added: WASEO
2006.09.18 added: Werner Raetz
2006.09.04 removed: LK Avalon
2006.08.28 removed: PD-World-Versand, New Generation Atari-Magazin
2006.08.27 Len Spencer, updated web page address
2006.08.27 Eric Parent, Memo Pad Release 4
2006.08.25 BAKTRA, mmSAP 1.2
2006.08.22 Eric Parent, Memo Pad Release 3
2006.08.22 MadTeam, MADS 1.7.4
2006.08.14 Radek Sterba, Raster Music Tracker v1.24, RMT Player v1.06
2006.08.13 MadTeam, XL-Paint 2.5MaX, 2.6MaX
```

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/ shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

4JAYS (Jay Colen) 9/04
519 W 4th St
Antioch CA 94509-1246
USA
Shop Phone: 925-777-1160
Store Hours: Tuesday thru Friday 12-6pm - Saturday 11-5pm
http://www.4jays.com/
Vendor: new and used hardware and commercial software

8-Bit Classics (Mr. Corey Koltz) 4/06
302 W Dewey St
Cassville WI 53806-9733
USA
Phone: 608-725-2137
http://www.8bitclassics.com/
Vendor: new and used hardware and commercial software

A-ONE Magazine - Atari Online News, Etc. 8/06
Dana P. Jacobson -- Editor
USA
http://people.delphiforums.com/dpj/a-one.htm
Publisher: A-ONE online magazine. weekly

Advantage Web Solutions & Computer Services (Jim Mason) 7/04
PO Box 561
Mason City IA 50402-0561
USA
http://www.jamess.com/
Developer: The Atari Weather Station -- build your own dedicated temperature monitoring station using simple thermisters and the provided

software. Also available: source code listing, temperature data aggregation utility

Alhart Enterprises Presents (AEP) 8/06
c/o Paul V. Alhart
524 N Z St
Lompoc CA 93436-5019
USA
tel: (805) 736-4624
"encoded" email: OOOp.alhartOOO@OOOverizonOOO.OOOnetOOO
Vendor: used hardware--mainly reconditioned disk drives: 810 (no case), 810 w/case, 810 w/Archiver, 1050, Rana 1000, 1050 w/doubler, Indus GT
Developer: AtariWriter+ Companion (disk), AtariWriter+ Companion II (disk), StarStuffer (disk), Search System II (disk), Atari BASIC Enhancements (disk), 8-bit TTL Logic Analyzer (disk), MagicCalc (disk), Games disk: Jacks Cargoship + Light Pen/(Light Gun) Tic-Tac-Toe (disk).
Publisher: RANA Repair Guide (book) - US$12
Repair shop: Atari disk drives

Altronic E.I.R.L. 6/04
Bolognesi 952
Bellavista
Callao 2
Peru
tel: (51)(1) 429-4298
Repair Shop.

Alltronics 8/05
PO Box 730
Morgan Hill CA 95038-0730
USA
Phone: 408.778.3868 Hours: 10am to 4pm Monday - Friday
Fax: 408.779.2608
http://www.alltronics.com/
Vendor: Atari CX85 Numerical Keypad, Blaster! Auto Fire Module, TV/Computer Switch

Atari800 Development Team 6/06
See also: Mark Grebe
See also: Christian Groessler

Atari Bit Byter User Club e.V. (ABBUC) 11/02
c/o Wolfgang Burger
Wieschenbeck 45
D-45699 Herten
Germany
Tel./Fax +49 2366 39623
http://www.abbuc.de/
Vendor: PD/freeware/shareware, hardware, commercial software
Developer: wide variety including: SIO2PC(SIO2ST)-Interface, PC-Xformer Cable, Automatic 2-Computer Interface, Switching Power Supply (SPS), 8-Channel dig. Voltmeter (DVM), XL Switching Interface, Speedy 1050 upgrade, RomDisk, QMEG+ 4.0.
Extensive hardware schematics for sale.
Has obtained rights to many products including: KE-Soft, Klaus Peters Elektronik, AMC-Verlag, Compyshop
Publisher: ABBUC Magazin (disk mag), ABBUC Sondermagazin (print mag)
Repair Shop.

The Atari Times (Gregory George) 2/05
USA
http://www.ataritimes.com/
Publisher: The Atari Times online newsletter,
The Atari Times Compendium (paper book, published annually)

Atarimax (Steven J. Tucker) 4/06
3978 Brookside Blvd
Cleveland OH 44111-5106
USA
tel: 216-577-8329
http://www.atarimax.com/
Developer: APE, the Atari Peripheral Emulator: APE and ProSystem v2.3.5 for Win 95/98/ME/NT/2000/XP, APE & ProSystem 1.18 for DOS/Win3/95/98, APE Warp+ OS 32-in-1 for XL/XE, APE Warp+ OS 32-in-1 for 1200XL, Imagic 1.06 95/NT - Atari Disk Image Conversion System (ATR/XFD/DCM/SCP), Imagic 1.06 DOS, Atari Terminal Simulator ATS 2.0 (SR2) - ATASCII Telnet/Serial Terminal & Break Movie Player 95/NT, Break Movie Screensaver 95/NT, MaxFlash Flash MultiCart (1Mbit or 8Mbit), SIO2PC/ProSystem Universal Interface, Atarimax/ABBUC USB Cartridge, MyIDE+Flash IDE Interface Cartridge (1Mbit)

AV Toolbox 1/04
USA
Phone 800-235-3280 or 859-647-1077
Fax 859-282-8225

http://www.avtoolbox.com/
Developer: a number of composite video<->VGA conversion devices,
including the Cheese Video Box. Connect your Atari to your PC monitor!

Subject: B

B & C ComputerVisions (B&C, Bruce & Cathy Carso) 1/05
5917 Stope Way
El Dorado CA 95623-4716
USA
tel: (530) 295-9270 11:00 AM to 4:00 PM Monday to Friday (Pacific Time)
http://www.myatari.com/
Vendor: new/used hardware, commercial/PD/freeware/shareware

Eric Bacher, with James Wilkinson 6/06
http://dis6502.sourceforge.net/ or http://sourceforge.net/projects/dis6502
Developer: Dis6502 2.2 (Interactive 6502 Disassembler for Win32,
designed to specifically support Atari binary files)

BAKTRA (Michael Kalous) 10/06
Czech Republic
http://www.baktra.wz.cz/
Developer: TURGEN SYSTEM 3 (for JRE; generate a Turbo 2000 sound record
from files for ATARI located on PC. Output to WAV file or direct output to
sound card.), QUO VADIS Intro (demo), mmSAP 1.3 (SAP player for GNU/Linux)

Richard Bannister 1/04
See also: Chris Lam
Dublin
Ireland
http://www.bannister.org/
Developer: Rainbow v1.5.0 - port of Rainbow 1.4 (Atari 800 series emulator
for MacOS 9) to Mac OS X, Emulator Enhancer v1.4.1

Lee Barnes 10/04
http://www.mathyvannisselroy.nl/mydos.htm
http://www.mathyvannisselroy.nl/aspi.htm
Developer: MyDOS RAMdisk patches, Black Box ATASPI V0.42 ("Atari (Advanced)
SCSI Programming Interface"), Black Box ATASPI V0.41

Ullrich von Bassewitz 5/04
Germany
http://www.cc65.org/
Developer: cc65 2.10.1 - a complete cross development package for 65(C)02
systems, including a macro assembler, a C compiler, linker, librarian and
several other tools.

BBK Enterprises (Bryan P. Schappel and Barry Kolbe) 7/05
See: RTS Software

Michael Beck 5/03
Germany
http://www.rho-sigma.de/
Developer: Atari 8bit filesystem for Linux 0.1

Matthias Belitz ("msc") 10/04
http://www.birmanns.de/atari/
http://www.mathyvannisselroy.nl/aspi.htm
Developer: msc-IDE Controller (IDE interface for PBI/ECI -- sold out),
IDE software utilities: INSTALL.COM V1.03, SETUP.COM V1.13, FDISK.COM V1.10,
MAP.COM V1.10, HDINST.COM V1.00, LMAP.OBJ V1.03, CDPLAY.COM V1.0,
CDREAD.COM V1.4, IMG2DISK.COM V1.00.
Black Box ATASPI V0.40 ("Atari (Advanced) SCSI Programming Interface"),
ATASPI CDPLAY V0.20 (audio CD player), ATASPI MON V0.12 (SCSI monitor)

Bensley Consulting (Brett Bensley) 1/04
PO Box 301
Westfield IL 62474-0301
USA
tel: (217) 967-5465
Developer: Happy's Programs - Math, U.S. History, Astronauts, Triangles

Best Electronics (Brad Koda) 8/06
672 Commercial St
San Jose CA 95112-1406
USA
Telephone: (408) 278-1070 (M-F 1:30pm to 5:00pm PST)
FAX: (408) 278-1092
E-FAX: (815) 364-3703
http://www.best-electronics-ca.com/
Vendor: new hardware, commercial software
Developer: "XE" Touch, Best Joystick, Best Light Gun

B.G. Micro 8/05
555 N 5th St Ste 125
Garland TX 75040-5097
USA
orders: 1-800-276-2206 or 972-205-9447 9am - 5pm CST, Monday - Friday
fax: 972-205-9417
http://www.bgmicro.com/
Vendor: Atari CX85 Numerical Keypad, hard-to-find chips for Atari disk
drives (per Russ Gilbert)

Big Five Software (Bill Hogue, Jeff Konyu, Curtis Mikolyski) 8/06
USA
http://www.bigfivesoftware.com/
Developer: Bounty Bob Emulator for Windows NT, 2000, 98, and ME

Bravo Sierra Computers (BSC) (Ben Smith) 11/04
Oregon
USA
tel: (503) 256-9974 "Ben's Benevolent Help HotLine" 24 hours

Aliens: Genocide, Aliens, Search for Newt, Computer Virus, Lunar Miner,
The Mad Camper, Nightmirrors, Pipeworks, Rooms of Rondomm, Rotile,
3D Tic Tac Toe, Blackjack, Catapult, Champion Greyhound Racing, Demonix:
Battle of Souls, Gennetixx, Knock Out!, Particles, Ripley's Believe It Or Not,
Psybercom, Saucerian, Saucerian II, Shuttle Run, Star Rider, Starlord 5,
Stellar Rescue, Teleport

Gray Chang 2/05
USA
http://www.concentric.net/~ktchang/
Developer: Dog Daze, Claim Jumper, Dog Daze Deluxe, Bumpomov's Dogs

Classic Computer Magazine Archive (Kevin Savetz) 2/05
USA
http://www.atarimagazines.com/

Publisher: authorized digitized editions of: Antic (1982-1990), STart (1986-1991), Creative Computing (1974-1985), Creative Computing Video & Arcade Games (1983), Hi-Res (1983-1984), Compute! (1979-1994)

Computer Games Plus 3/04
PO Box 6144
Orange CA 92863-6144
USA
tel: (714) 639-8189
http://www.gamesplus.com/
Vendor: commercial software, plus a few power supplies

Computer Software Services (CSS) (Bob Puff) 4/03
1350 Buffalo Rd. #2
Rochester NY 14642
USA
tel: (585) 429-5639
Fax: (585) 247-7158
http://www.nleaudio.com/css/
Vendor: hard drive systems, SIO cables, hard disk controllers
Developer: Black Box, Black Box with 64K Printer Buffer, Black Box Printer Cable, Black Box Modem Cable, Floppy board, Super-E Burner, Gang Super-E Burner, Multiplexer, Multiplexer Slave Unit, Quintopus, Quintopus with Switchable Ports, Super Archiver, Super Archiver II, Super Archiver --> SA II Upgrade, XF Single Drive Upgrade, XF Single Drive Upgrade (without Drive Mech), XF Dual Drive Upgrade, XL Dual Drive Upgrade (without Drive Mech), XF551 Enhancer, XF Update, Ultra Speed Plus OS, Hard Drive Pro Backup, Super Pill, Disk Cracker, Black Patch
Shareware developer: SuperUnArc 2.4, SuperArc 2.4, Disk Communicator 3.2, MYDOS 4.50, BobTerm 1.21, MYDOS WHEREIS, MYDOS VTOC FIX
Repair Shop.

Cosine Systems (Exin [Sebastian], Intensity [Arman], Odie [Sean], 1/06
Sack [Adam], Magic Roundabout [Jason])
United Kingdom
http://www.cosine.org.uk/
Developer: demos: C.G.M. UKScene Radio Intro, 1K Party. game: Reaxion

Preston Crow 2/06
USA
http://www.crowcastle.net/preston/atari/
Developer: binload v2.5 (with Chad Wagner - Atari binary load format file analyzer), atr2unix v1.2 (with Chad Wagner - Extract files from an Atari DOS or MyDOS .ATR file), unix2atr v0.9 (Extract files from a Unix directory tree and create a MyDOS ATR-format disk image file), dcmtoatr v1.4 (written by Chad Wagner), MyDos Binary Menu, SIO2Linux 2.0.1 (with Pavel Machek - a rewrite of SIO2PC software for Linux), DISK 4.0 (sector editor and more)

CyberRoach Publishing (Hans Reutter) 2/05
Seattle WA

USA
http://www.cyberroach.com/
Publisher: authorized digitized edition of A.N.A.L.O.G. 400/800 Magazine
(1981-1982), ANALOG Computing (1982-1989)

Subject: D

D'Antiques (Dan Dotson and Marilyn Saul) 9/06
PO Box 40751
Tucson AZ 85717-0751

FAX: (561) 658-0835
http://www.dantiques.com/
Vendor: used hardware and software

Jan Detlev 11/02
The Netherlands
http://www.detlev.myweb.nl/ or http://home.wanadoo.nl/jdetlev/
Vendor: new hardware and software

DGS 11/03
See: Dean Garraghty

Dial Group (Zenon, Voy, Jager) 5/05
Poland
http://www.serious-dial.atari.pl/
Developer: DOS Control v2.6. demos: MayDay!, Smells like a cream?,
What is love?. utilities: TwoCol v1.0, D-Font View v1.1, D-Sample v1.0MS,
D-RAM v1.1, X-RAM v1.0, DocView Maker v1.0, D-Trans v0.9, Short Test v1.2,
Moj Cartridge v0.1, TOMS Multi Drive ROM-disk Maker, ProgBaza v1.5,
Double RAM-Cart. games: Dreszcz - Fighting Fantasy Game. system:
Scene Register v5.0.
Publisher: Serious Magazine (disk mag), 1998-

Marius Diepenhorst 10/04
http://www.mr-atari.com/hardware-3rd.htm
Developer: "SpartaDOS for MyIDE"

Digital Force (Mario Trams) 11/02
Germany
http://www.tu-chemnitz.de/~mtr
ftp://ftp.tu-chemnitz.de/pub/Local/informatik/trams
Developer: HyperSpeed XL/XE (public domain hardware project-- a
65C816 Processor Extension for the ATARI XL/XE)

Florian Dingler 5/03
Germany
http://www.akk.org/~flo/
Developer: Sheeprace, Cardgrabber, Icehockey (each games that require the
Multijoy interface)

Discount Video Too (Gary) 11/03
3223 S US Highway 1 Ste F
Fort Pierce FL 34982-6380
USA
tel: (561) 464-0019 1pm-9pm (EST) Mon-Sat
Vendor: commercial software and some hardware

Draco (Konrad M. Kokoszkiewicz, KMK) 6/06
Poland
http://drac030.krap.pl/ or http://drac030.atari8.info
Developer: for standard Atari: DEMON, EYE, SysInfo 2.11, SD-Load. for SpartaDOS X: CP v.1.2, MAN, SpartaDOS TAR v.1.3a, mdump, run, inidos, ca2001, XF-551 Config. for KMK/JZ IDE: IDE BIOS 1.11, KMK/JZ IDE user's manual, Utilities diskette, HDSC v.1.4, MaKe a SpartaDos FileSystem, RW-Test. for 65c816 Atari: 65c816 XL OS v. 2.11 (5.VI.2006.), D2D v.0.5, grep, LPOKE/LPEEK, MultiBASIC v.0.33, MultiBASIC Manual, SD-Load. patches for: Moon Patrol, Music Protracker v.2.4, Perestroyka Demo, Prof!'s XDIR. for UNIX: SIO2BSD

Adam Dunkels 3/03
See Also: Christian Groessler
Stockholm
Sweden
http://dunkels.com/adam/contiki/
Developer: Contiki Operating System and Desktop Environment. Includes: Multi-tasking kernel, Windowing system and themeable GUI toolkit, Screen-saver, TCP/IP stack, Personal webserver (only in the C64/TFE version), Simple telnet client (only in the RS232/SLIP version), Web browser

7766. Welcome to comp.sys.atari.8bit!

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-06 04:24:22 UTC
From: Michael Current <hunmanik@earthlink.net>
Message-ID: <atari-8-bit/welcome_1160108646@rtfm.mit.edu>
Source record: 5773
Cross-posted to: comp.sys.atari.8bit,comp.answers,news.answers

Archive-name: atari-8-bit/welcome
Posting-Frequency: 7 days
Last-modified: February 16, 2006

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

7767. IRC chat on #atari tonight!!

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-06 12:09:44 UTC
From: Greg Goodwin <Greg.Goodwinp0.f2.n8.z8@fmlynet.org>
Message-ID: <0008f170@familynet-international.org>
Source record: 5774

FamilyNet International Newsgate

You've requested it, you've begged, and so someone opened a IRC channel, and
some of us last Tuesday during the chat tried out the IRC Atari channel.

And we will be there again tonight!!

The location is IRC= irc.openirc.net/#atari

Will be starting at 8 pm CST and going till... whenever!!

See you there!!

"But how can I get there with an Atari computer?"

I'm glad you asked. :)

telnet to...
telnet.familynet-international.net once there...
"chat" & "G"
then ...
/ircjoin irc.openirc.net
then /j %#atari

Been on numerous times with the Atari 800. ;)

FamilyNet <> Internet Gated Mail

Good turnout last night, including a new face or two. Besides any
scheduled IRC chats, at least a couple of us tend to be (sometimes idle) in
the channel, so feel free to drop in any time. :)

7769. Keyboard pinouts XE and XL

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-07 19:19:49 UTC
From: Oliver Graf <oliver@knusperkopf.de>
Message-ID: <eg8ukk$s69$1@news01.versatel.de>
Source record: 5776

Hi everybody,
I am planning to give my 130XE an new home in an obsolete
desktop case. Because of ergonomic and stability reasons
I would like to use an XL keyboard. I know the pinouts of
XE and XL keyboards are different. Is there any information
about these differences available on the web or on one of
your hard drives ;-) ?

Thanks in advance.
Oliver

7770. Re: What is your favorite 8bit game of all time?

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-07 21:20:24 UTC
From: "Matt J. McCullar" <mccullar@flash.net>
Message-ID: <sSUVg.14117$7I1.211@newssvr27.news.prodigy.net>
Source record: 5777

Top of my list is _Star Raiders_. I almost wore out the electrons in my
Atari 5200 with that one. :)

Others in my Top 10 list include:

Starmaster by Acitvision for the 2600.
Breakout for the 2600
Video Pinball for the 2600.
The Dreadnaught Factor for the 5200 by Activision

Thank you very much for sharing this information. At this year's
CommVEx v2, I saw a prototype USB cartridge for the Commodore (shhh!).
I will forward this message to the appropriate developer(s).

I've got a Happy 1050 with Happy Rev 2 ROM and as such the Happy Software "Set to US Emu" option "only enables fast writing" rather than full US Doubler emulation. Any ideas where I could get the "Happy Doubler" program (description as follows)???:

"Happy Doubler - Allows you to program your Happy 1050 drives to fully emulate ICD's U.S. Doubler, including formatting disks in the U.S. sector skew (which is not normally possible!). Also allows you to re-program your drive numbers up to D8:, without touching the switches in back! This way, up to 8 - Happy 1050s can be used at once! (4 - programmed as Doublers 5-8 and another 4 - as normal). Completely software based, no installation required!".

Wasn't 'Track and Field' that game that you went crazy with the joystick?
You moved your stick back and forth in real time to make the man run and
pushed the fire button to jump. I could only last about one event before
my hand gave out.

Many thanks Ed, but the "Happy Doubler" program does not appear to be in the Holmes utilities archive - unless I am missing something.... If it helps anyone, the program was by Innovative Concepts and retailed at $19.99 and was released in 1989. See: http://www.atariarchives.org/cfn/05/11/0160.php.

7777. A little ditty...

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-09 18:46:34 UTC
From: Bill H <bill@ts1000.us>
Message-ID: <1160419594.719809.290510@c28g2000cwb.googlegroups.com>
Source record: 5784

Back when I was bout 17 or so (1983) i figured out this little 5 or 6 byte ML program that would take the values from the timers (18,19,20 I believe) and them poke them into the sound registers, then loop back to do it again. To stop it you would have to reset the system. It played a pretty neat ditty if I remember correctly with a beat and everything. I used to enter the program in on any Atari I could find setup at a store and then walk away.

I would love to hear this again, but my 6502 m/l knowledge and Atari memory map is totally gone (buried under usless Windows information). Anyone think they could recreate it?

I use to just poke it into memory from the READY prompt (I think I used page 6, but I may have used zero page).

Bill H www.ts1000.us

Sure was a joystick wriggler, which is why I didn't like the Wico stick,
long and not fast enough. I set some records back in the old days, but
nowadays, I don't know. Track and Field was also released with a special
controller, three buttons to smash wildly. Cool stuff

Take Atarian care

Well I remember getting a msg saying it would be down for 30 minutes...
that was at 5 pm... and it said to go to irc.catch22.org (6667) did
that...and no one is there. So I am pretty much at a loss. I looked
up OpenIRC on the net and it seems it does this quite often. So with
that said, there are other servers that are affiliated with this one,
but doesn't default over to openirc.org. It goes to a different server
altogether. So, I am not exactly sure what to do :(

Based on this, we've opened a room on newnet - irc.newnet.net, channel
#atari. I'm told by someone affiliated that we can depend a bit more on
it.

See you there!

As I remember,to set the drive number to 5-8 was in firmware in the
rom.
Once set,you could not use the drive as 1-4.

Anyway,this is all that I know.Sorry I was not more help.

You might want to contact Steve Carden at:

http://www.atarimax.com/

That is where I bought my Happy enhancement. A GREAT Atarian!

I had been looking for that program for several years when the author sent a post about some other things he had written. IIRC, he indicated that he had lost it, so unless someone pulls the rabbit out of the hat, it is unfortunately g-o-n-e.

As I recall, the main purpose of the program was to be able to format a disk with the doubler interleave. The Happy should easily be able to reporduce that format, although using the Happy Backup to reproduce a "raw" formatted Doubler disk would be a pita. I also seem to remember that there is a BASIC program that can use the Happy control codes to produce this format. Look for the "Happy Utilities".

I had always assumed the terminal attached to the rs232 port as well. But, then you couldn't use a modem. As yuo made me realise, the terminal has to attach to the sio connector This isn't hard to figure out. With pinouts of sio and de9, its a matter of making a null modem cable probably. This is how you can hook up an atari with an 850 to 4 atr8000s. If there is enough interest, I can wire up a cable, change the jumper and see what happens.

As I see the circuit has been traced. The jumpers make the null modeming,
People have pu in a front panel switch for the terminal setting and the
reset button on back.

I think I got approval to put the schematics on my site. Mine are tif, but
I think I'll change to gif.

7790. Graphics mode question.

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-11 04:07:07 UTC
From: mr_i_davis@hotmail.com
Message-ID: <1160539627.446657.263760@i3g2000cwc.googlegroups.com>
Source record: 5797

I am writing some assembler code and have a question. I am writing my own DLI, and I am leaving some space for a screen in Antic Mode 7, Basic Gr. 2, which is a 20x12 screen. All the docs I can find state that this takes a 420 byte block of ram. How is that, since 20x12 is 240. When I store a char in the memory, I can fill the screen using the 240 bytes. Where are the other 180? I am blocking out 420 bytes to be sure, but am curious as to where 241-420 go.

Also, it looks like it's much easier to manage your own screen real estate, and much faster, than going through the CIO routines. Unfortunately, there doesn't seem to be much documentation on going about this. I am just loading the accumulator with the char I want, and dropping it in the appropriate byte to make it appear on the screen. Am I on track here?

Thanks in advance,
Isaac

Not a good answer, more what my faulty memory pulls up.

If you are using ANTIC mode 7 then you are right, you only need 240
bytes. If you are using BASIC GR.2 then BASIC set up a GR. 2 screen with
a GR. 0 text window on the bottom. I seem to recall the kicker is: Even
if you eliminate the text window by using GR. 2+16 BASIC still sets up
space for a text window. It's 3 or 4 lines of 40 characters per line
with a LMS commands so that bulks the RAM usage up a bit.

I think there actually was a use for this. Something like you could have
a GR. 2 screen, save the text window location, then go to GR. 2+16 to
make it disappear. You could then add info to the text window and have
it appear instantly by just switching the text window in and out.

You want to write directly to the screen. Screen memory starts at
PEEK(88)+256*PEEK(89)
There isn't a 1:1 correlation between characters and their screen
counter parts. I assume this is because of ASCII(32) being a space but
you want a zero in screen memory so as to display nothing. ANTIC mode 7
uses high bits of the character to pick what color/color register is
used for it.

Thanks for the info Rick. I am going to reduce the memory I am storing
for the screen to just the 240 bytes. I have set up my own Display
List, so I am picking where the screen memory is located, as I have to
point to it in the DL. Then it's just a matter of popping my data onto

the screen. When starting the code to my program I was using the gr.0 screen to display the data so I could debug it, and using the CIOV routines to push the data out. Now, I can just store it right on the screen memory locations. Looks like I am heading in the right direction. I just really wish I had put this much effort to learn machine language, back 20+ years ago. It's really nice to finally conquer it though.
Isaac

7793. NTSC Coulor Question

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-11 09:32:15 UTC
From: Paul Cawley <paul.cawley@clara.co.uk>
Message-ID: <1160559126.62810.0@demeter.uk.clara.net>
Source record: 5650

Guys,
I just imported an NTSC 130XE, my question is that when I use it, the colours appear different on the screen -best way to describe would be washed out- compared to my PAL 130XE.
I could have understood this if I was running through RF, but I am using a SCART cable out of the monitor jack.
Admittedly the picture is far better on my CRT TV as opposed to my LCD one, but the colours are still out.
By comparison, my NTSC NES looks the same as the PAL on (just minus the borders and slower speed!).
Any ideas, is this normal?, I think it probably is, but wanted to check!
Cheers,
Paul

7794. 8-Bit games worth

Source record: 5651

Guys,
I am also about to offload some 8-bit titles, but before I do, wondered what
I am likely to get for them on eBay (all disk versions).

Ogre (Origin, still shrink-wrapped, mint uncrushed),
Zork 1 (Infocom, complete but not wrapped, sticker on front),
Zork 3 (Infocom, still shrink-wrapped, mint uncrushed),
Starcross (Infocom, still shrink-wrapped, mint uncrushed),
Spellbreaker (Infocom, still shrink-wrapped, mint uncrushed),
Sorcerer (Infocom, still shrink-wrapped, mint uncrushed),
Seastalker (Infocom, still shrink-wrapped, mint uncrushed),
Ballyhoo (Infocom, still shrink-wrapped, mint uncrushed),
Deadline (Infocom, still shrink-wrapped, mint uncrushed),
Suspect (Infocom, still shrink-wrapped, mint uncrushed),
Night Mission Pinball (Sublogic, still shrink-wrapped, mint uncrushed),
Alternate Reality (US Gold, open but looks new),
IQ (CRL, New unwrapped),
The Payoff (Atari, still shrink-wrapped, mint uncrushed)

The below are all complete, but opened
Astro-Droid,
War-Copter,
Day at the Races,
Starquake,
Sidewinder,
Zone X
Sunstar,
Maltese Chicken,
Battalion Commander,

If they are not worth selling, I will put back in the attic!
Cheers,
Paul

Even though I'm sure I tried it in the past, I couldn't resist seeing this
two-liner here without typing it in, so I just did so on my 130XE.

And how sweet it is! Thanks for a smile for the day.

Everyone here should be required to type this one in!

I didn't recognize any as collector items but in general I would say
~$20 per title for unopened. If there is something in there that is
collector worthy, I know an opened but complete Ultima III went for ~$85.

Paul it's hard to say what they are worth. If you want to get a
ballpark figure, then do a "completed auction" for each title most will
probably get you some results and you should get a good idea of their
value.

With the keyboard..take a qwerty layout, run lines vertically(two halves) and horizontally, and you get an 8 x 8 matrix, encoded into 6 bit. Add bits for shift and control, you get a byte for each regular key. Special keys decoded seperately.

So an "A" is 63, "P" is 10, etc. All keyboards do this in some fashion.

Internally, these codes get changed to atari version of ASCII. "A" is 65, "P" is 80. At least its mostly close. All computer manufacturers do some form of this too. Software changs this with a look up table.

For displaying on the screen, you normally fill memory with zeros. But that is the heart graphic character. So you have to rearrange the atascii into internal so zero becomes the space. So "A" is 33, "P" is 48. Rearranging the codes speeds up the display, little math and conversion.

I have some of this on my site
at...http://www.a8maestro.com/atari/info/kdbgrid.htm.
Atascii to internal is coming.

For some reason if I am in the emulator, I go back to the Atari keypresses
(shift-2 for quotes, control for the arrow keys). It's really weird...

>Alternate Reality (US Gold, open but looks new),

At least those anyway... don't know much about the others. Like someone
else suggested, do a completed items search on eBay to get a rough value.

NTSC XEs had some bugs in the video circuit, for starters. I minor fix
involving the removeal / replacement of, IIRC, 4 resistors and the addition
of 2 caps. One thing you may want to play with before ripping out resistors
(and taking a chance on ruining the notoriously fragile traces on the XE
boards) is playing with the color pot on the board. Tweak it all the way in
both directions while it's connected to your display and powered up, and see
what you get. You might be surprised.

Does your TV support NTSC? Even via a SCART it needs to understand the
colour timings etc.

7805. FS: Atari 800/XL/XE SCART cables - special offer

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-12 11:20:57 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1160652057.668212.143930@m73g2000cwd.googlegroups.com>
Source record: 5662

Hello All,

I have an overstock of Atari 800/XL/XE to SCART 1.5m (5.5 feet)
foil-screened cables to clear, so I am offering them to
comp.sys.atari.8bit readers at a much reduced cost.

Prices start at £2.08 delivered per cable for the UK, and £2.50
including Airmail delivery to Europe. Because SCART isn't really used
outside of the UK/Europe, the offer is only open to readers in the UK
and Europe.

Payments are in UK£ and by PayPal ONLY. Payment buttons are on the
order page, or you can PayPal the money directly to me if you prefer
(details on the order/info page).

This offer is only open to readers of this group, so you will need to
go straight to the order/info page at:

http://www.dgs.clara.net/scart-a8-oct06.htm

The offer closes on 20 October 2006 (or earlier if stocks are
exhausted).

Before anyone says it, yes I know people could make these cables
themselves. But at these prices why bother!

To find out more about us, and to see what else we sell, you can visit
our main site at: http://www.dgs.clara.net

I believe this refers to the "Super Video for the 130XE" article from Atari Classics mag. I did this upgrade, and it did improve the saturation/intensity, but overall, made the picture no better (IMO) than other XE's that I have. (I still use this machine to this day.) One down-side is that it made the faint vertical lines/bars on the screen that can be seen on modern monitiors much more pronounced. Based on my experience, this is a "fix" that fixes little. (The Super Video for the XL is a different matter -- excellent results.)

If interested, you can check this out at
http://www.geocities.com/atarimods/

You'll get redirected, but I checked this link this AM.

FWIW, I have had lots of XE's, and I have never seen one that had washed out color. Not saying yours does not on your equipment, but I'd be skeptical that applying this fix would do much. OTOH, it's not hard to do and is reversible.

-Larry

comp.sys.atari.8bit,comp.sys.atari.st,rec.games.video.atari,rec.games.video.classic,rec.games.video.marketplace,pdx.forsale

I'm done updating my catalogs with NEW information! My software and books catalogs are now 80 columns except for hardware which are still 38 columns. I no longer have catalog named NEWINBOX.TXT... New items have been moved into corresponding catalogs. For instance ST_SOFT.TXT Now has both USED & NEW ST Software. New items are listed with a NIB by price. NIB=NEW in BOX!

FREE Catalogs for Used & New Classic Atari 8 Bit & ST Computer lines plus Atari Jaguar Games and Consoles! View Catalogs on-line, Download them or Feel free to Request catalogs by E-Mail. Really, it's not an inconvenience. I ask that you specify 8 Bit, ST and/or Atari Jaguar! Or all 3! Then I'll send them to you by E-Mail. Let me know if I can/cant attach files to your E-Mail. Atari@aracnet.com or call (503)256-9974!

http://BensCatalogs.Atari.org FREE ATARI CATALOGS!
http://www.aracnet.com/~atari/specials.htm ATARI SALES DETAILS!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Is there a myspace type site that is a place for programmers to post
their apps for people to download? It would have to be user friendly
like tucows but allow a programmer to create their own home page where
they can post their apps (including open source if they wish). People
can network and link to each other, rate other's apps, and search for
code by platform/language/keyword/most popular, etc. It would support
EVERY platform imaginable, from 8-bit atari code to .NET and Java apps.
Does anything like this exist?

Yep, it's called sourceforge, but in that you have to have it open
source.
```

Sure there is - have you looked into Sourceforge? (www.sf.net)

Last I knew, Sourceforge was platform-independent, and it certainly doesn't
matter what kind of code/programs you post there.

Hi
I'm looking for a couple of the paper "XL/XE Library Update" leaflets that
accompanied issues of Page 6 / New Atari User magazine - specifically those
from issues 74 and 78. A copy, scan or whatever would be just fine.

If you can help, please reply via the contact form on the Page 6 website:
http://www.page6.org/contact/contact.htm

Many thanks,
Paul

Stick a 8bit core into a tiny fpga board, and you can have your laptop
pretty easy.

7818. Announcing the Computer Gaming World Archive

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-15 06:46:10 UTC
From: Stephane Racle <sracle@nospam.com>
Message-ID: <4531d9ac$0$4197$baae4c71@news.mindlink.net>
Source record: 5675

I'm pleased to announce the online availability of another magazine:
Computer Gaming World (CGW), from 1981-1992. This isn't platform
specific, but contains tons of Atari gaming coverage.

Highlights:

-102 issues saved as .PDF files
-Every issue processed through Optical Character Recognition (OCR),
enabling a 3+ million word global index
-Bookmarks and links for ease of navigation
-7438 pages covering 11 years of gaming

The CGW Archive is a CGW Museum product, published by Ziff Davis (who
own the right to the content). The issues are freely available on Ziff
Davis' FileFront website. Read the entire fake press release at the CGW
Museum site.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Howdy folks

For all those who do not know:

Next saturday, the yearly meeting of the members (JHV) of the ABBUC will be held from 10.00 untill 17:00 o'clock (that's 5 PM for you guys from the opther side of the Atlantic).

It'll be held at the B�rgerhaus S�d in Herten, Germany.

All ABBUCmembers (and those who want to become a member) are welcome.

Don't let language be a barrier. Main language will be German, but many do speak English, some speak Dutch.

There wil probably be some new hardware, even more old hardware and probably some old hardware that's been either redesigned or build from the old plans with new parts. The ABBUC Software and Hardware contests will be held. And somebody has promised that we will have a lot of fun with a multijoy interface, joysticks and footpedals (all at the same time).

See you in Herten?

Mathy

PS diner will be afterwards, but pre-ordering it is appreciated/needed (I'm not not sure). See www.abbuc.de

If I can get my hands on a pre-made one, I plan to cram it and a hard drive into the case of a borked XF551. Someone tried to do a 3.5" upgrade to it and totally destroyed about half the traces on the board. Whoever it was got a little overzealous desoldering the ribbon cable from the control board and REALLY screwed it up when he soldered on the pins for the removeable ribbon connector. I tried repairing traces on that board for over 6 hours, and in the end I gave up.

But, the power supply and case is good, so cram in a hard drive, the SIO2IDE, and probably spray paint the whole damned thing black and let 'er rip!

I just bought an untested BB and I do not know much about it. How should it react? It seems it should bring up a menu when pressing the leftmost push button, but nothing happens. I tried connecting my Adaptec adapter with the ST225 drive (works on MIO), but it does not try reading or anything. Is it broken? If so, anybody have clues on what might be wrong, where to get parts or where to send it for fixing.

I am also feeling stupid, thinking a Black Box would actually be a black box with the interface inside, but it's just a print board. Are they all like this?

Thanks and take Atarian care

Hi,
Try looking at this web site for information:
http://www.mathyvannisselroy.nl/blackbox.htm
one of the best information site's for the blackbox...

And of course the original site for the black box:

http://www.nleaudio.com/css/products/BB_Docs.htm

As a guess at your problems might be the power supply connection.. verify
pinouts and voltages..

Good Luck!!
RoyE

Thanks for the links. I think PSU is correct, the green light go on as do the red one, when I boot computer. But pressing the setup menu button, does nothing.

Will read through the pages tonight, after Liverpool match is done. Take Atarian care

Guys,
Got my 8-Bit games from the loft and up on the 'bay right now.
Items are in the UK, and in Pounds Sterling (shipping will be slightly
higher to the US/abroad), but you will be hard pressed to find some of these
in this condition again.
Have a look through, lots of sealed titles, will be more of these in the
coming weeks, plus C64 stuff as well.

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZcawley1

Cheers,
Paul

> the red one, when I boot computer. But pressing the setup menu button, does
> nothing.

You can find the manual to the BB in the CSS site (link was in Roy's
posting).

There is another way to get into the menu. Look for "how to get to the
BlackBox's menu via software" at the bottom of my (resently cleaned up)
BlackBox page. BTW the switch IIRC is a switch that breaks the
connection when pressed.

Often, if the switch doesn't work or one of the lights (LEDs) doesn't
come up, is a back connection between computer and BB.

Greetings

Mathy

Hi Vidar-

If your PSU is good (+12, +5, -5 VDC IIRC), then check the ECI connector and your XE connector to make sure they are scrupuously clean. (Or your XL PBI connector if using the cable connector.) Any "flakiness" of my BB has either been due to a bad PSU or poor connections between my XE and the BB. If it still doesn't work, then "untested" may mean "non-working." ;-) Good luck. -Larry

Thanks again!

I tried both my 130XE and 800XL, but none of these works. But, if like mentioned, the lights do go on, I guess the connection is okay. The green light is constantly on, when power is connected. The red light goes on when I boot computer, then stops when computer is ready. I'll try the software thingy to see if I get a connection at all. but guess it's a non-working BB. Does Bob stilll repair them?

Yes, I've tried that, I too use a MIO. First thing I tried. But it says in manual that the leftmost push button brings up the menu. It does not do anything. I'll try the software setup later. Thanks for suggestions!

Howdy Vidar

> > If your PSU is good (+12, +5, -5 VDC IIRC)....

You absolutely need +12 and +5, but the third voltage can be -12 as well as -5 Volt. I'm using -12 Volt as most switching PC power supplies have -12 Volt on some wire. Bob Puff told me you can use either.

> Does Bob stilll repair them?

He'll probably try to diagnose your problems on the phone. He's really good at this. He'll take time for you if you call. Emailing him might not result in you getting an answer anytime soon.

BTW, on some older manuals, an old area-code is used. Your best bet is to check the site (www.nleaudio.com/css) for the right phonenumber. And Bob is very kind and patient on the phone, even if you stammer like an idiot. (been there, done that. :-))

Greetings

Mathy

Source record: 5603

Hi there. In my collection I have an Atari600XL. Unfortunately, like a few other things I have it doesn't work.

On turning it on it displays a plain brown screen. That's it. Totally catatonic.
Any ideas what it could be? Unfortunately I know little about the specifics of the hardware in it.

Any help or ideas would be appreciated.

Thankyou.

Hi Tristan,
that can be caused by a bunch of dead ICs.

Check these:
U2-5, U18, U19, U28, U30

Hi,

Most chips are socketed in the 600xl, so removing or reseating them
might help.

Rory

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

> Cheers,
> Paul
>
>
Paul,

even though your using a SCART connector, you will *not* be using the
RGB signal pins, but the composite video pins. The composite video from
any US Atari will be NTSC format, whereas your TV expects PAL. Having
said that many modern TVs sold in the UK are actually multi-standard.

The difference between NTSC and PAL is the way the colours are encoded,
and this may explain why they appear washed out.

My own TV accepts PAL or NTSC. When I played back a US DVD on my DVD
player the colours were washed out, which I assumed was because it was a
TV series from the 70's. However when I entered the menu on the TV, I
now had control over "TINT". This is a bit of a giveaway that the TV has
detected a NTSC signal. PAL TVs don't have a tint control.

I was also surprised when I tried a US videotape in my video recorder,
that not only did it play back OK, but understood all three tape speeds
(LP, SP and EP).

regards...

Source record: 5613

Howdy folks

> But, the power supply and case is good, so cram in a hard drive, the
> SIO2IDE, and probably spray paint the whole damned thing black and let 'er
> rip!

If you need a SIO2IDE interface version 3.x, contact mega-hz (Wolfram Fischer).

BTW, I saw one of Wolfram's 1050's. It has a harddrive, a SIO2IDE 3.x interface inside and .... the viewer of a camera. Yep, that's a CRT, black and white picture, about 3 to 4 cm diagonal. That's slightly over an inch to one and a half inch. The picture displayed on it (which comes from an "external" XL or XE) is crystal clear.

Greetings

Mathy

BTW mega-hz has his one site, but my browser couldn't make contact. Try : mega-hz.no-ip.com

Guys,
*** New stuff added! ***
Got some vintage Commodore / Atari / Infocom games from the loft and up on eBay right now.
Items are in the UK, and in Pounds Sterling (shipping will be slightly higher to the US/abroad), but you will be hard pressed to find some of these in this condition again.
Have a look through, lots of hard-to-find titles (most new, some sealed), will be hopefully adding more of these in the coming weeks, on various formats.

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZcawley1

I am not kidding - you have to have a look at these!!!
Cheers,
Paul

7861. FS eBay: Atari XL/XE QUICK Programming Language - less than $2

Newsgroup: comp.sys.atari.8bit
Date: 2006-10-29 20:16:46 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1162153003.26412.0@damia.uk.clara.net>
Source record: 5618

Hello All,

I am selling electronic copies of the QUICK programming language on eBay (which includes ATR and DCMs of the disks and a PDF manual) for just £0.99 (less than US$2). This is a promotional price to 'test the waters' with this kind of distribution, so if you want to take advantage of it, you can buy one on eBay now:

UK/Europe: http://search.ebay.co.uk/_W0QQsassZdeangarraghty

US: http://search.ebay.com/_W0QQsassZdeangarraghty

Full info on QUICK and what is included, and how the product is sent to you is in the listing.

Dean Garraghty

Hi Jeff.

I'm interested in the Appl2, Coco and CP/M things you have.

Please send details when it's convenient for you to my gmail email
account.

For my own interest, I've recovered several Apple2, //e and GS models,
several Mac Models, a TRS-80 CP/M BOX with two 8 inch floppy drives
AND
good bootable floppy diskettes! (that was fun to see it still works!)

I await with baited bits! :)

be well.

You really should have a look at this video. It was a great meeting.

You can also look at YouTube for some video's from boschreurs

Greetings

Yes. You will regret it forever. I did so many years ago and still miss the stuff. Sure, you can replenish the supply later - but it still won't be the same stuff really.

If you don't have room, rent a storage shed for $50 a month. I do. I have loads of useless crap. Maybe one day I will be rich enough to buy a house. Then I will collect even more!

> Black Boxes. Thanx! ===Ben===

That's new to me. That fact that Bob won't sell directly that is. What
I do know from a reliable source, is that they have enough parts to
assemble the FloppyBoard.

But Lance is a good guy. And a lot more active in the 8 bit scene
nowadays then Bob.

Greetings

Mathy

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Very, very true.

> If you don't have room, rent a storage shed for $50 a month. I do. I

I got a lot of cardboard boxes and stacked them in the closet. Some of the
larger systems I stuck under the bed. Now that I have my own place I'm
slowly extracting and rebuilding my old systems. The same ones!

You have to be rich to buy a house?

Shit, I owned my first house at age 30 and don't consider myself to be rich
by any stretch of the imagination.
How much is an average 3 bed 1 bathroom house in the US on 820m2 block worth
in a reasonable neighbourhood?

Well, maybe if you live in that house alone. But if you are married to
a woman, beware she will not allow a huge amount of antique computers
to be stored there. Unless you are fortunate to find one of those very
rare women who are also Commodore geeks. This is highly unlikely
considering when Commodore's were populare in the 1980's, very few
girls cared anything at all about computers.

> ****, I owned my first house at age 30 and don't consider myself to be rich
> by any stretch of the imagination.

I bought my first house when I was 26, and I still live there.
However, both my wife and I work full time in order to afford to live
there.

Continuing on about the collection, though. My collection is about as
big as it will ever get unless we move to a new house with a lot more
storage space. I have almost every 8-bit commodore ever made (except a
PET and the CBM machines) and also have a lot of Apples and Amigas.
But they rarely see the light of day. Unfortunatly, when I see a
Commodore 64 being thrown away somewhere, my heart tells me to save it
and preserve it. However, I have no more space for it. And I know
that when I die, it is likely my children will throw the stuff away at
that time anyway. So I would only be postponing the inevitable, and
wasting valuable space in my house in the meantime.

I bought my house at age 24 and it was paid off 6 years later with help from
my other half who also works full time :-)

I would be tempted to pick it up and at least save any socketed chips. They
don't take much space and could be important in the future when supplies run
out.
Then again, where do you draw the line...

Wow, welcome to "comp.sys.rich.people".

My wife and I just bought a house/land, $87,000, payment is $780 a month,
we have 3 kids, 3 cars, a dog...and there is no way in the world we could
ever pay it off in 6 years. (and thats with our combined yearly income of
about $75,000). :(

7886. *UPDATE* more on my retro computers collection *UPDATE*

Newsgroup: comp.sys.atari.8bit
Date: 2006-11-01 17:36:01 UTC
From: "proteanthread (at yahoo)" <rtdos@rtdos.com>
Message-ID: <1OWdnfYlQenORtXYnZ2dnUVZ_qydnZ2d@bresnan.com>
Source record: 5643
Cross-posted to: comp.sys.apple2,comp.sys.atari.8bit,comp.sys.atari.st.misc,comp.sys.cbm,comp.sys.ibm.pc.classic

I am currently working on a list and will be posting it to my website shortly:

http://www.rtdos.com/list.txt (dead link right now but should be up sometime next week)

so if you are interested in my collection, please check there first to see what is available; its on a first come first served basis (recipient must pay for all shipping up front) however i will honor the best offer (i've already recieved hundreds of emails and phone calls); i don't like doing this (i'm already regretting it) but i absolutely have no room (or money for storage) that i want to give my collection someone or multiple someones who appreciates these retro systems.

i have no intentions of leaving the retro community (my alt os for games based on the classic systems is still my priority); currently i'm looking to download (or get someone to donate cd's or dvd's of) emulators, sources, bios's, roms, programs, etc. that pertain to these systems that i have (or had at one time).

its like giving a puppy or a kitten up for adoption, you want to make sure that they get a good home; thats the way i feel with my retro stash (of course i am to blame if nothing works for i kept my collection in storage for 10 years); basically i want to give my collection to the community (i will part out,but each recipient must pay shipping in full up front) as my collection is as much a part of me as it is a part of the retro community.

so if anyone wants to donate cd's or dvd's of collections of programs, emulators, sources, drivers, bios's, roms, etc. of anything retro related (even if they are not to recieve any part of my collection) i'd appreciate it (as i said i have no intentions of leaving the retro community once my physical collection is depleted). :-)

right now i have about 40 more of appx. 50 boxes left to go through, i have about a dozen or so monitors (composite so they should work with nearly any system with an rca jack); several boxes of ibm pc compatible cards (already claimed by a local pc repair service), several printers (atari, tandy, commodore, apple), tons of books and manuals, etc. (don't worry i have another storage area that'll i'll be going through once the stuff in my house is depleted)

I bought my house at age 10, no need to take loans and on top of that, I have lots of saved money.

My wife loves my huge collection of home computers and video games. Recently, she convinced me we could squeeze a third Asteroids arcade game machine in the master bedroom.

Wait, there's more! Our kids wear Commodore and Atari t-shirts when they go to school. The dog too likes retro computing, always wearing his tiny vest with a superb handmade Amiga logo.

We've got two brand new Lexus jeeps professionally painted with Pac Man and Donkey Kong artwork.

I will be back in these newsgroups later, with more information on the proceedings of my simple, still satisfying life.

Anders

Greetings everyone!

Here is the lucky and the proud winner of this months prize at The
DarkForce! BBS:

October 2006
1. ST Magazine - Dew-It wins the free 3 mag. subscription

Congratulations to our winner!

Also, here is next months prize:

November 2006
1. ST Magazine - some lucky Atari caller will win a free 3 magazine
subscription.

Good luck to all! :D

7890. Vintage Computer Festival 9.0 this weekend

Newsgroup: comp.sys.atari.8bit
Date: 2006-11-02 01:28:06 UTC
From: rbernardo@value.net
Message-ID: <1162430886.336638.325350@m73g2000cwd.googlegroups.com>
Source record: 5647

Hello to all my Atari cousins!

Below is the announcement I posted to other newsgroups, but it would be good to see you there, too! :-)

Come one, come all to the Vintage Computer Festival 9.0, Nov. 4-5, at the Computer History Museum in Mountain View (San Jose area), California. http://www.vintage.org

Nestled in the heart of the Silicon Valley, the Computer History Museum is full of analog and digital computers harking back to as early as the 1940's.
http://www.computerhistory.org

Join the 500 to 700 VCF attendees to listen to the speakers (Steve Wozniak!), marvel at the exhibits, and buy the vintage computer goods of your dreams. The Fresno Commodore User Group will have its usual demonstration/vending table. Come and meet me and FCUG members, Ed Hart, Clark Murphy, Bill Ward, and Mitch Zollinger. Who knows who else you will see wandering through the rooms? (Amigan Dale Luck is a regular VCF attendee.) Come to our table and play with a VIC-20 system, a SX-64 system, NTSC and PAL C64 DTV's and the Hummer DTV, an Amiga CD-32 (this time with several different discs), and a Vectrex (hey, what's that doing here?). As usual, we will have C= hardware and programs for sale - C64's, C128's, 1541's, 1571's, a SX-64, On the Edge books, and more. As usual, we will have cakes, cookies, and punch to hand out to anyone who asks. As usual, there will be other vendors who will have Commodore and Amiga items.

New for this year, Bill Ward will be bringing a video projector and screen on Sunday so that we can have big-time Commodore/Amiga gaming! Also for the first time, I will have an exhibit with a very good-to-excellent condition Commodore PET 2001 with plenty of programs for it to run. Also, check out the strange and mysterious, outboard "sound box" for the PET. Larry Anderson and your PET/Flash Attack exhibit, watch out! :-D For more information on my exhibit or the other exhibits at VCF, go to http://www.vintage.org/2006/main/exhibit.php

Car already packed for VCF,
Robert Bernardo

What took you so long. I bought my house two years before I was born
and the seller PAID me to buy it.

I constructed a time machine and went back in time 100 years and bought
several houses for a penny. So, by the time I was conceived, I was already
a property magnate.

My butler used to bring me am-biotic fluid on a silver
tray whilst I was in-utero.

I was the only sperm that already owned a ferrari.

After I was born, I paid someone else to be circumcised for me.

My first bottle was 100 year old scotch.

instead of a dummy, I used to suck on cuban cigars.

>
Hi,
If you mean DOS instead of OS. This depends on which DOS you are using:

With Atari Dos an AUTORUN.SYS file can be run before Dos is entered.
With MyDos an AUTORUN.SYS file can be run before Dos is entered.
Also FILENAME.AR0 will work with the later versions of MyDOS.
With SpartaDOS or BEWEDOS a batchfile will be run to start your command
file.
Also DOSXL a batchfile is needed to run a command before the Dos
prompt.

Regards,
RoyE
PS: give a sample of what you want to accomplish for more clarification.

> plz help
You might want a menu loader boot disk, like
for many games that can't load from DOS because
they overwrite DOS.
The menu loader boot disk will put a very minimal
loader in place, then give a list of filenames to
load, which you select a letter A, B, C,.
You mention wanting to load a 'system commander'.
Perhaps you might want to be more specific what
you want to load and run. The closest thing to a
'system commander' I can think of is a machine language monitor, like
Omnimon, which is an
alternative OS on a chip, rather than a boot disk.

Apparently, it is not easy to find an institution willing to
accept a large lot of what they see as *very* specialized
equipment.

A "typical" technology museum is much more interested in breadth
(Apple, Commodore, Sol, etc., etc.) than in depth in a single line
of machines--even if it is the single most influential machine in
the pre-standardized world of computing. ;-)

Apple II's just need to outlive all of those "other" platforms. We already have an advantage from all of the surplus machines cast off by the education industry. Now all we need is a climate controlled bunker in northern Canada to stash our machines once we kick the bucket. 500 years from now, when nothern Canada will be a tropical paradise, we'll have prettier piles of plastic, metal & fiberglass dust than anyone else. We'll show those rat bastard commies then! :-P

I'm sorry meyti, I can't follow what you want, what
you've already done, and what you want to do.
You say you want 'write run', means you haven't
written it yet, then you say 'i wrote' indicating you
already wrote the program. What program?
What program do? What language you writing in?
If you wrote a 'boot loader', then you must be
writing in machine language and have the ability
to alter the boot sectors of a disk.
The OS will execute when you turn on the computer.
If a disk drive with disk is there, it will load the
first sector, extract information from sector 1 and
then continue with the boot sequence.

Guys,
Vintage Atari 8-Bit games ending in around 12 hours - take a look!

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZcawley1

Items are in the UK, and in Pounds Sterling (shipping will be slightly higher to the US/abroad), but you will be hard pressed to find some of these in this condition again, have a look through, lots of hard-to-find titles (most new, some sealed).
I will be listing approx. 90 more titles this evening, the bulk of them being HTF Atari and C64 titles, mainly on disk - there will also be Vintage PC, Amiga and Atari ST - I am not kidding, you have to have a look at these!!!
Cheers,
Paul

Been so long I probably have a few details big time WRONG here but I am sure someone will jump in to correct me.

Easiest was is to have a disk with a MEMSAV on it, very important or DOS may step on your code. Compile your code so it is memory resident and go to DOS. Once in DOS do a binary save<Option K> and give the file name autorun.sys, address range to save and the initiate address of your message and the start address of your code.

You can have more then one init address in a file if you combine them using the copy /A<ppend> option. Favorite trick of programmers was to run the message to screen first followed by the loading of the code, that way you didn't have to add a delay so people could see the message.

There's other ways of doing it. For instance you can load your binary with the /N option from DOS so it doesn't run and do the save/init from there. I liked to compile to disk and just stick in the init address at the end of my code. There is no one right way to do it but 3-4 different ways that all get it done.

The music on the title screen of Cosmic Tunnels was really
something special. Both the melody and the original
swaying not so square waveish voice.

While all of us beholden to the "One Ring" have to live with this to some extent, it's pretty common in Japan to find a girl with a childhood gaming background.

My wife complained a bit about the price of the Mac mini "we" purchased ... until I had it playing old Famicom (NES) games and MAME. While she beats me at Popeye and a handful of crazy Japanese games, I'm content to hand out lessons in Robotron.

So I like mine just the way she is too. ;-)

Cheers,
Nick.

7918. FS eBay: Atari XL/XE PPP 4 Games Pack - less than $2

You need an emulator of course, but the link to my new page is :
http://games.nmi.no/atari/a8bit.htm and go to Gary Gilbertson page
My main page is at : http://games.nmi.no/

Found a few other collection he made too, for Antic and two AMP demo disks.

Now I want the music from Alternate Reality :: The City

Take Atarian care

BTW : It might not be finished uploading yet, so if you don't get the page,
try later

7920. Umich archive?

This is assembly, not machine language.

> <W 100 0 0 1>

You're in the wrong group then. This is for 8 bit atari's, they use a
6502, and not a 8080 or Z80 or any derived processor.

So long,
Thomas

Your code is for x86 machine, not 6502.
So you're using an x86 assembly language.
> I make ".bin" file and wrote the file into boot sector of floppy

I think you might not be in the right group, this
is x86 stuff. Are you using an Atari 8-bit?
Good Luck

Would this work.... It is still web based but.. similar to ftp: indexed
directory..

http://www.umich.edu/~archive/atari/8bit/

depends on the method of download..

If you're interested in a quick way to download the contents of the web
site, you can use wget (http://www.gnu.org/software/wget/wget.html). e.g.
"wget http://www.whatever.com/whatever/blah -r" would grab everything found
at blah and whatever it links to (such as subdirectories full of archives).

Alternatively, use Firefox and the Down(load)ThemAll extension. I did ;)

It can be used to get 'all linked files' from a webpage. You still have
to open each page, but it beats clicking on several hundred files.

Kind regards,
Wef

Wow, what a retro question. There was a time when that was maybe one of
the most frequently asked questions here!

I can't find any trace of FTP support at the long frozen UMich archive,
nor can I find a UMich mirror supporting FTP. You may have stumped us!
Hopefully one of the many other suggestions will work for you.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Vidar,
I think you are looking for Server Side Includes. IE:

<!--#include virtual="insertthisfile.html" -->

That should do the trick.

There are any number of ways to do this but it depends on what
facilities your hosting company offer or what tools you are using. Can
you provide more info?

If you are using something like Dreamweaver or Frontpage you can use
templates where one change will fall through to all pages based on the
template.

I think wget is his best choice. Or use 'off line browsing' features,
depending on the browser hes using.

Thanks for all the hints. I am using (dare I say) MS Internet Explorer. What is wget? Linux/Unix command?

I seem to remember back in the old days, I used something called mget (Multiple get?) at the school where my friend went.

Take Atarian care

wget binaries are available for Windows (as well as many other platforms).
If you follow the link in my first post along with my notes, you should
find everything you need.

You can only get the rest of the series on DVD. Here's the website:

http://www.onceuponatari.com/

It's well worth the purchase to get all four episodes on one DVD.

Well, but it's all using the same software player. Some minor
differences can be found (there's something like a v1 and a v2).

The same player is also used by the "Passonately" (sp?) music demo,
BTW.

So long,
Thomas

I have a semi defective drive here. Just wondered if you knew what the weakness of these drives are. It didn't read disks, I took it apart and after squeezing the chips and feeling the solder points, it suddenly started again.

Is there any particular part of the print board that is weak? I ask because it's the second drive that goes down for me. My 1050's are flawless, never a problem-

Thanks for any pointers

Re-solder the SIO jacks to the PCB, then add bolts in place of any plastic
rivets. This is the most common failure besides the mechanism itself in
the xf551.

Last-modified: February 16, 2006

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

7949. update on list of items

Newsgroup: comp.sys.atari.8bit
Date: 2006-11-16 06:15:23 UTC
From: Jeff Wood <post@newsgroups.net>
Message-ID: <fPadnRNw8J7An8HYnZ2dnUVZ_qCdnZ2d@bresnan.com>
Source record: 5456
Cross-posted to: comp.sys.acorn.misc,comp.sys.amiga.misc,comp.sys.apple2.usergroups,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.ibm.pc.classic,comp.sys.sinclair,comp.sys.tandy,comp.sys.ti

well the list is up; opened up some more boxes today; these were some of the heavier boxes, more than likely books or monitors or odd systems; so far what i have found is 3 of the 4 boxes contained books; however, 2 of the boxes so far appear to have gotten wet or seriously damp; the books in those boxes were mostly of the BASIC Programming Language (guides, programs, etc.) of various systems (oddballs such as those from tab, BBC Micro, Acorn, etc.); those are gone. (some are stuck together, others, the binding is gone) i know i did not store those like that and not sure how the area got damp or wet (smells like mildew) as the box doesn't appear to have been wet. another box had about 2 dozen intellivision cartridges (some with radio shack logo on them for the clone made by radio shack) which also appeared to have gotten wet (they were in another area of the shed) as there is some corrision on the contacts. i live in a dry climate so humidity is out of the question.

i was hoping to finish up the rest of the boxes by this weekend but that doesn't look like its going to happen. what i'm gonna have to do and should have done is selectively check each system for corrosion and or power up a few systems here and there to make sure something works. :-(

the 2 problems i am facing: short on time and short on space. it'd have been nice to have opened up all these boxes in a wharehouse type enviorment. lol.

i'll keep ya'll posted thru the link i supplied earlier.

they say that there is a silverlining in every rain cloud; i certainly hope thats true here.-Jeff

Who's currently using the APE OS+ upgrade? I'm considering this hardware hack on my 800xl, but I'm not yet committed. My 800xl already has a MUX ROM and other mods (memory, video, audio) and I'm hoping there'd be no conflict or issue like I experienced with my beloved 768k XE

Sorry about the format of this post.. It was from me, but via Google.

My 768k XE died a few years back and I've been using my 256k XL, and
would rather have an XE if I'm going to continue using an 8bit.

This message typed on my 800xl, connected via Telnet using a UDS10!

7960. Looking for a XL Demo with a Sheep.

Newsgroup: comp.sys.atari.8bit
Date: 2006-11-18 09:15:57 UTC
From: J�rgen Strobel <odity@odity>
Message-ID: <12ltjjl91jc516a@corp.supernews.com>
Source record: 5467

Hy, i saw a very funny Demo on a German Party called "XZentrix" (the Party;)
and after that i was not able to find the demo on the Net...
Maybe someone can help me?!

The Demo loaded and after taht a Sheep was shown which was turning round and
Round making funny faces and other things. Between the scenes where the
sheep was shown, there was fast cut ins with some text and drawing like
Graffiti.

There was a second part of that Demo, where the Sheep have other movements.

The Sheep was a copy from an old Windows 95 Fun-Screensaver where the Sheeps
fall from above and run over the Windows.

Maybe someone can help with the Name of the Demo or a download URL...

Thanks so much in advance
Tolkin

7961. FA: Re-listed Hard to Find C64/128, Amiga, ST, PC auctions

Newsgroup: comp.sys.atari.8bit
Date: 2006-11-18 20:49:05 UTC
From: Paul Cawley <paul.cawley@clara.co.uk>
Message-ID: <1163882941.23128.0@proxy02.news.clara.net>
Source record: 5468

Guys,

*** Re-listed due to eBay stupidity! ***

Less than 24 hours to go, with plenty of HTF titles in as-new condition, including a bunch of great PC, Amiga and ST titles, as well as plenty of C64 disks, including a couple of C128 specific, many still at their listing price!
Items are in the UK, and in Pounds Sterling (shipping will be higher to the US/abroad), but you will be hard pressed to find some of these in this condition again.
Seriously - have a look through, lots of hard-to-find titles (some sealed), I will also likely be putting up a large number of Atari 8-Bit titles this coming Sunday (12th November).

http://search.ebay.com/_W0QQfgtpZ1QQfrppZ25QQsassZcawley1 (US list)

http://search.ebay.co.uk/_W0QQfgtpZ1QQfrppZ25QQfsooZ1QQfsopZ2QQsassZcawley1 (UK list)

Cheers,
Paul

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

RELATED NEWSGROUPS:

7967. FS eBay: Atari XL/XE QUICK Programming Language Package - less than $2!

Newsgroup: comp.sys.atari.8bit
Date: 2006-11-22 11:01:13 UTC
From: Dean Garraghty <dgs@clara.net>
Message-ID: <1164193273.436931.303910@h54g2000cwb.googlegroups.com>
Source record: 5474

Hello All,

I am selling electronic copies of the QUICK programming language on
eBay
(which includes ATR and DCMs of the disks and a PDF manual) for just
£0.99
(around US$2). This is a promotional price to 'test the waters' with
this
kind of distribution, so if you want to take advantage of it, you can
buy
one on eBay now:

UK/Europe: http://search.ebay.co.uk/_W0QQsassZdeangarraghty

US: http://search.ebay.com/_W0QQsassZdeangarraghty
(as at the time of posting it hasn't shown up on the US site yet, but
it should)

Full info on QUICK and what is included, and how the product is sent to
you
is in the listing.

Dean Garraghty

Hello,

I have finally finished the first batch of the rverter 2 type sio to
rs232 interface. Called SPEEDIER:. Runs up to 19.2K baud.
This is an EASI/O device. Inroductory special includes this cable, free
for a limited time. $30.00 plus any shipping, tax, and paypal fees.
Read the advert for more info.

7975. Removable drives (Syquest, etc)

Newsgroup: comp.sys.atari.8bit
Date: 2006-11-29 04:59:49 UTC
From: jamesk@ATxmissionDOT.com
Message-ID: <ekj445$3as$1@news.xmission.com>
Source record: 5482

Just curious how many of you are using removable media on your Atari 8bit systems..

At present, I have 3 x Syquest 44mb and 1 x Syquest 135mb removables (in addition to 2 x 130mb SCSI HD's) via blackbox; arguably more storage than I could reasonably use.

Additionally, I'm using Ape ProSystem 1.18D via a really old all-in-one Compaq Prolinea Net 1/25S system running MSDOS 6, Novell Client32 (connected to a NetWare 6 server) for high speed access to all my ATR/XFD files.

One day, I'll take time to finally convert all my old 5.25 and 3.5 disks into .PRO, .ATR or .XFD formats.

How those Syquest removables interfaced?
Seems like my Sparq drive is a Syquest.
You must have more than 8 drives, and
more than 16 megs per partition. My IDE
was/is the only thing I think does more than
16 meg partitions.
I use APE also, don't hook up my MIO hard
drives.

Just an FYI, this page appears completely blank in Firefox. I was able
to view it in Internet Explorer though.

Last-modified: November 15, 2006

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I only use two. The 5.25" floppies and the cassette tapes. They count
as removable media, don't they? ;)

I wish I had that. By the way, how many kilobytes per second can the
Atari computer handle?

> One day, I'll take time to finally convert all my old 5.25 and 3.5 disks
> into .PRO, .ATR or .XFD formats.

When that day comes in my life, I will go through the cassette tapes
and the floppies from my early years of BASIC and machine code
programming, and store all files on my home PC.

Anders

I have a 300mb Fuji or Fujisu (diff?) SCSI drive, and a Syquest 200mb removeable on my TI-99/4A (I just recently acquired another 6 200mb disks for it, $1 a piece + shipping).

I have a spare 200mb removeable, and two spare 300mb hard drives.

Due to limitations of the device driver, you can only address 250 mb. I've not found a drive more reliable than these SCSI drives. I did have two hard drives setup, but it was more than I needed, so I'm just keeping them as spares. The only thing I found that was important was to NOT reformat the 44mb Syquests on a 200mb drive - it renders them useless (at least on the 200mb drive). I have/had a few I did that to, not sure I kept them. Here is a good link:
http://www.kassj.com/articles/SyQuest.html

To the other poster with a Sparq - I had the parallel port version - I traded for the two 200mb Syquest drives and a few disks for them. I got the better part of the deal. The Sparq was a 1GB version, but had the "Iomega" click of death problem (I've never had that with my Iomega ZIP drives) where it ruins your disks... it would spin up and down, not eject, etc.

I was honest with the person I was trading with...

I have the blackbox configured with about 30 x 16mb partitions spread
across the various devices configured.

I mostly use APE for backups and for using it a print que, for printing
to a network connected laserjet.

I didn't read it with respect to 88mb drives, but I did have problems
on my 200mb system.
44mb cartridges are slower on a 200mb drive, and if you format them
they no longer work...

Well, its December, and that means we're giving stuff away for the Christmas season!

First up, our usual 3 month subscription to ST Magazine.

Next, we're giving away an Atari Mega STe motherboard!

Last, but not least, is an Atari 8bit game, Guderian.

Our winner for November 2006 is Sauron - he won the 3 month subscription to ST Magazine!

I've decided that I need more specific information about what users want, when it comes to our monthly prize giveaway. So there is a new menu option from the mainmenu. It's "M" for Monthly Prizes. Users who wish to register for our monthly prize giveaways should pick this option and choose whatever prize they are interested in. Your choices will be registered to a logfile that I can check at the end of the month. Users can register for as many prizes as they want, but please only register -1- choice per item, per call. You can register multiple prizes in one call... Thank you all! :)

Congratulations to our winner, and good luck to everyone on this months prizes! :)

7989. Atari Lynx on CDROM

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-02 15:40:28 UTC
From: jamesk@ATxmissionDOT.com
Message-ID: <eks6pc$1it$1@news.xmission.com>
Source record: 5496

Anybody purchase the Atari Lynx collection on CDROM from
thepelican@sympatico.ca?

I just bought some 8bit and Lynx gear off eBay, and one of them
contained a flyer for 90 playable games on a single CD.

AtraX SDX 128

------------------------------

Subject: Introduction

Conventions
-----------
All commercial vendors, developers, publishers, and repair shops should be
listed here. "Active" PD/freeware/shareware developers should also be listed.
Persons or entities holding rights to products, but not selling or supporting
them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products
sold are given in categories: new hardware, used hardware, PD/freeware/
```

shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web page address.

Unless explicitly requested by the vendor, no entries will include an email address due to the overwhelming amount of spam that would result.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the

information contained in this list is constantly updated. Please use the
latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to
send me updates that correct errors that you find. If you use this
list, please do your part in keeping it useful for everyone!

Hi James! Long time no see! :-)

You've touched upon an area I'd like to investigate but haven't yet gotten
around to. Any "surprises" or "tricks" involved in getting SyQuest 44M
drives hooked up to the BlackBox? I've got a BB and am hoping it's as
simple as plug-and-go, but... For one thing I wouldn't know what "drive
geometry" to tell the BB. 2 surfaces, maybe, but... then what? :-)

> Additionally, I'm using Ape ProSystem 1.18D via a really old all-in-one

Hoping to set up an old PC here as a DOS box and run something like that.
In my copious free time...

> One day, I'll take time to finally convert all my old 5.25 and 3.5 disks
> into .PRO, .ATR or .XFD formats.

I've done most of the first 200 or so of my own disks; only about 1000
more to go...

Of course, this doesn't count the bad-sectored or otherwise-copy-protected
disks. I've been out of the loop for a while; does there yet exist a
solution for imaging-and-emulating such disks? I'm thinking it could be
done with a track-, rather than sector-, based disk emulation on the
emulator side, and a track reader using something like the Archiver
device, on the Atari / disk-imaging side. Anybody done it?

Cheers,
Chris Chiesa
here on and off since 1987

Now THAT's an interesting idea. I'd like to hear more about how to do this sort of thing. (I don't have a network-connected printer (yet), but do have an old laser printer going to waste. Heck, for that matter, I still have my old Atari-compatible dot-matrix printer sitting there going to waste. Don't know whether it would even operate at this point... let alone whether I could still get a ribbon for it. Anybody?)

That reminds me; I also have an external SCSI Zip drive (original 100Mb
type). Any advice on hooking THAT up? Same questions as I just got done
asking about the Syquests...

Back in the 90s I worked with VMS workstations, and one thing we worked hard at was making it possible to transfer files among various kinds of computers (mainly Macintoshes) and the VMS machines. Sometimes we didn't have enough actual drives to go around, or we just plain needed to reconfigure for a different project -- and it often turned out that an external SCSI drive that had been used on a Mac would come up nonfunctional on the VMS machines, yet continue to work on the Mac. After much hair-pulling we found that the Mac SCSI driver was quietly setting two configuration bits (just TWO SINGLE BITS!) in one of the low-level SCSI "mode pages" in the drive, and the VMS SCSI driver would reject a drive with those two bits set. We eventually got a utility program for the DEC Alpha (as opposed to VAX) version of VMS that would let us edit the mode pages and clear those two bits, making the drive accessible to VMS once again.

So why tell you all this? Because I currently have a 44M SyQuest drive that won't work on a VAX/VMS workstation in my basement, but DOES work (aside from filesystem issues, anyway) on my Windows 2000 PC. Unfortunately I don't have the VAX version of that mode-page-investigation-and-editing tool, and haven't been able to find an equivalent program for Windows. And I thought I ought to spread the word that this sort of thing is possible, in case one of you guys tries to use a SyQuest drive that works with a PeeCee (or a Mac!) on your Atari and runs into a similar problem. I'm not saying you WILL, but I'm concerned that you COULD, and now you know what kind of thing might cause it and how you might try to fix it if you can find (or write!) the necessary software.

One of these days perhaps I'll get around to writing such an application myself, but even the documentation of how to read/write the mode pages on any computer I know how to program (VMS, Windows, Atari, Amiga) is scarcer than hen's teeth. So if anybody here has a handle on any such things, let me know. You scratch my back, I'll (try to) scratch yours.

Chris

No, but it sounds like I'm going to have to check it out!

_90_ games? How many (if any) are bona fide Atari games (at risk of
copyright/piracy issues) and how many are third-party after-market stuff?
I know the programming information has been floating around for a few
years now... In any case, it sounds very interesting.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Hey everyone - don't forget about the weekly Atari chat tonight. Official gathering time is 8:00pm CST, and you have 3 options for getting in:

- Use your favorite IRC client to connect to irc.newnet.net and join channel #atari.

- Telnet from your 8-bit or other machine to irc.atarichat.net (216.37.55.109) and login as "atari". This will get you into the chat without the need for an actual IRC client.

- Use the Java applet found at http://www.newnet.net.

If you can't make it around 8:00 tonight, or if you would like to stop in other times, feel free to drop in anytime. There are generally a few lurkers hanging around, so you may catch some good coversation at any random visit.

I was hoping the place I work would've thrown away a Jet-Direct box so
I could put my old Epson AP-3250 on the network and print to it from
different computers. It would have been fun.

Wonder what happens when it receives requests from different systems at
the same time?

Well, just put some old PC together (in my case, a 1980's era 486), get
APE (I use 1.18D Registered), and just parallel connect your laserjet to
the PC.. Voila, instant laserjet printing from your 8bit Atari..

These are disks produced by Database Publications/Europress to accompany their "Atari User" magazine (the disks have simple computer printed labels but are originals). They were not supplied as standard with each mag but had to be ordered separately, and therefore very few were sold and even fewer still exist - I've not seen them on eBay before!

When using the Blackbox at least, I can't format, but I can 'erase'
them..

If you can get the head/cylinder count, I'm guessing you should be able
to access it after you've partioned it. Are you using a BlackBox or MIO?

As to prepping Sysquest drives, set them up on your blackbox as follows (44mb):

Heads 2, Cylinders: 1275, Type: 7, 512k Sector

Then just prep. using FMTDIR.

Any questions?

Yes, I remember liking it better than Shamus in the 80s mainly because I couldn't finish shamus. Case 2 was easier, but it's incredibly annoying if you fall in the wrong area to have to repeat 1/2 of the game.

Synapse produced some very good games in their time. Shamus was a very popular title of theirs. Zepplin was very fun along with Nautilus. They had a very good line of games. They also produced an assembler that wasn't too bad but was overshadowed by MAC/65 and Atari's Editor/Assembler.

Hi,
Are you sure that this has a 50 Pin Centronics end. Just asking because I
would like to know which printer it will attach to. I have a couple of
printers but they're both 36 pin Centronics. Maybe a Scsi printer for the
ST line.
RoyE

You're right- it's a 36 pin. The package says "Atari to Epson"

Thanks

Hi,

http://www.retrogames.cl/sio2lpt.html sees this Web.

They describe interface SIO-2-LPT.

The author corresponds to another person, but they describe it well.

I do too but that stupid bat still annoys the crap out of me. It's
much easier on an emulator since you can use the keyboard, especially
in the green room with the hangman prize

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

For those of you with whom I had such a great time chatting Wednesday (or
was it Tuesday?) afternoon / evening, know ye that I DID TRY to get in for
the Thursday chat last night, but wasn't able to. My Opera-web-browser's
"chat" facility -- which turns out to be an IRC client -- sat in
"Connecting..." for about two hours and NEVER DID actually connect.
Dang. Any speculation on whether the problem is at MY end or the OTHER?

This won't stop me from continuing to try, but whatever's going on MIGHT
continue stopping me from SUCCEEDING. :-(

Hm. I don't THINK it was I who said that -- looks like I was just quoting
somebody -- but now that you've mentioned it, what would be the DIFFERENCE
between "formatting" and "erasing" a 44meg SyQuest disk, in the sense you
mean it here? And what BB operation corresponds to "erasing" such a disk?

So much to learn, so little lifespan!

Nope; that seems straightforward enough.

Now, wouldn't it be nice if I could then pop the cartridge out, put it in
another drive attached to my PC, and immediately use it as a disk drive
with an emulator? Anybody doing that? :-)

It was _me_ who said you couldn't format a 44mb in a 200mb drive. I'd done
it, then the disks wouldn't work anymore, _then_ I found the link.

Of course this wasn't on an Atari, but I don't see the difference.
However, the difference between "erasing" and "formatting", the latter
tells the SCSI system to write down new tracks, the latter just sets up
your file system on top of the drive.

If you are familiar with PCs and floppy drives (remember those?), it is
the difference between a "quick format" and a "full format".

Sounds like a good deal. 12 years ago I had to go to all the
effort & trouble of making one like this. But isn't 8 feet a mite
on the long side? In the olden days we used to worry about signal
degradation.

The group "Makers Of Video Games" will be releasing a game code named
Tic Tac Toe Plus.

Tic Tac Toe Plus is a game which will utilize the same simple rules and

gameplay as the very popular Tic Tac Toe game, however, there will be
added features, rules and variations in the way in which the game is
played. It is expected to be more strategic and

A demo of Tic Tac Toe Plus will be released on 27 Dec 2006 for
commercial playing.

Reply to reserve a demo copy of Tic Tac Toe Plus on its date of release.

8031. FS: Rare Atari 1400XL Prototype and Power Supply

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-19 00:26:48 UTC
From: "atari@charter.net" <atari@charter.net>
Message-ID: <1166488008.620128.183490@t46g2000cwa.googlegroups.com>
Source record: 5538

I am selling my rare Atari 1400XL prototype and thought I'd give the newsgroup a shot at it before I list it on eBay as it was purchased through the news group almost five years ago. It includes the rare Atari 1400XL power supply as well. The computer is in like new condition but is missing the case label as most Atari prototypes of that period are. I have not taken the time to modify an Atari 1200XL label as others have done. The computer works fine but the keyboard is in need of new/cleaned contacts. It uses a standard 1200XL keyboard so swapping one in may be the easiest solution. I will be listing the computer on eBay December 28th if no acceptable offers are made. Here are some photos:

http://webpages.charter.net/nickandlori/atari-1400xl/1400xl-1.jpg
http://webpages.charter.net/nickandlori/atari-1400xl/1400xl-2.jpg

8032. Missile Command - home computer vs arcade

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-19 11:41:23 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <DdQhh.26889$E02.11086@newsb.telia.net>
Source record: 5539

The original Missile Command was an arcade game machine
with a trackball type of control over the crosshair type of
target symbol that the player moves across the screen.

So is it on the arcade version possible to quickly move the
crosshair from one spot to another on screen by spinning
the trackball?

If that is the case, the home computer version of Missile
Command sure must be less exciting than the arcade. Moving
the crosshair at constant, slow speed with a joystick disagrees
with the concept.

Anders

The arcade version seems to give you more control of the screen's pointer using the tracker ball because the user can use the tracker ball to move the pointer freely in much more directions than the home computer version and also the speed can be controlled or maintained.

The arcade version sounds much better, however it may take some time to become acquainted with the tracker ball. It will take a while.

Yes, also you only have the one fire button. In the arcade version you could shoot from the closest base and since the trackball let you go quickly from one side to the other this could be a good way to save yourself.

Missle Command is the only program I am aware of
that uses the Atari 8-bit track ball. It is much more fun than using a
joystick. The Atari trackball for the 8-bit also allows use as a substitute
joystick mode.
You need a trackball to play MC most fun.

Does the Atari trackball detect ball spin speed?

Anders

8038. Re: Missile Command - home computer vs arcade

You would need to acquire the version of the trackball that has both the joystick emulation and trackball mode switch on it. In trackball mode (which the 8bit Missile Command supports) direction and velocity is detected. If you play it in joystick mode than it's going to move at a constant rate in the direction your moving the cursor.

Right but the 8 bit will accept a ST mouse instead of a trackball.

IMO: After you get used to the mouse it is the best version and you can
rack up some really high scores.

Wow what a nice collectible and in such good condition. This model
has a built in modem and speech synthesizer right? I was wondering if
you ever tested the speech synth out? I have only my old Atari 400
from the 8bit days and would like something this rare, but I have no
idea what a reasonable price would be. I'm sure way out of my league.
How much did you originally pay for it?

Kev

This computer has the wire-wrapped modem board that you can see in the
photo. The product literature that was widely distributed mentions a
speech capability but I have not tried it out and am not even sure if
it is included. I originally paid $900 for the computer in 2002.

Using a mouse instead of a tracker ball will obviously make the game
significantly easier.

I prefer games with a challenge, thus I'll use the tracker ball if I
have to.

Anders asked if the trakball senses speed of the ball.
I guess so.
But the trakball isn't 'harder' than the joystick, it is
much better control of the missle command crosshairs.
But the game goes faster than with the stick, I think.
You can get a pretty good score with the ball.
I think you have to hit 'T' at the beginning of the game
to enable trakball version, seems like.
I very rarely actually play it any more, so memory
may not be right.
Rick says you can use an ST mouse instead of the
trakball, in 'T' mode, I guess, never tried that.

What? Didn't you ever use a trackball to play Pacman with?!

Back when Atari 8-bits were state-of-the-art in "home" computers,
some video games played better with a trackball than a joystick. And
then there were some games that played worse, sometimes a LOT worse,
but using a trackball made it more challenging or more interesting,
or just plain crazy!

I wasn't/ain't aware you could use a trackball with Pacman. I might even
break out an 8-bit and try it.
I've always been frustrated by the joystick with Pacman,
seems like it doesn't respond sometimes and you get bonked.
You hit a 'T' to get the trackball version?

The sad thing is that I have never seen an arcade version of Pacman with a tracker ball as the control, only a joystick. However, for a game like PacMan, I would prefer joystick.

In my opinion, trackballs are for games which have an almost indefinite number of directions on the screen whereas games in which the directions are finite and limited, where they are either up, down, left or right, the joystick would be the best option.

Don't have an answer for you but I absolutely hated the 8-bit version of Missile Command. I seem to recall slow tracking with the joystick but worse than that there is only one missile site.

Part of the fun of the arcade version, for me, was trying to manage the three missile inventories. Often using the side launchers to throw up a defensive screen while saving the center launcher for precision hits.

Recently, I was happy to learn that Paul Lee produced a nice hack for A8 Missile Command. He brought back the three launchers. You can play Missile Command+ using 3 keyboard keys to control missile launchings. Plays just like the arcade version. Of course you need a desktop joystick.

If you don't wish to play using keyboard + joystick (or trackball) then you can use the alternate method (smart tracking?, I forget the name). Use just the joystick (or trackball) with just the Fire button. The program will launch the missles from the launcher nearest the targeted point. This might at first seem to be a cheat but when you deplete missiles from one launcher you will quickly learn how difficult the game is if there are only missiles remaining on the WRONG side of the playfield. (They require more time to reach the target point).

Paul Lee has released both an ATR version and a ROM image of Missile Command+. Be aware that the Missile Command+ image is 16K in size where the orginal Missile Command was only 8K.

See details at link below.

->Or, is that using the joystick mode on the trakball? I think
->that's what you're talking about. You can use the joystick mode
->with any joystick game.

No, I'm not talking about 'joystick mode.' I mean using a track-
ball as a trackball to play a game that's meant for joysticks. With
some games that idea worked fairly well. As I recall, Centipede and
Millipede were in that category. The Pacman family of games were
not. For those, trying to use a trackball simply made the game ex-
tremely bizarre. (What you'd call 'frustrating'!) I pretty much
played those games out so there was no challenge left except to go
for the bizarre.

->I wasn't/ain't aware you could use a trackball with Pacman.

Technically, yes. But it's only good for laughs!

->I've always been frustrated by the joystick with Pacman,

Better not try it, then. Using a trackball on Pacman games is
only for burned-out Pac-experts who have nothing better to do with
their time. <grin>

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Didn't like my answer in comp.sys.ti? Google is your friend. You will find the #1 TI list using Google. There is no replacement. We need no others. There have been many attempts, they have all failed for one reason or another.

Besides, given your post here, I wouldn't want to associate with you anyway...

At least until you grow up.

Exactly. There is no room for more than one list. ONLY ONE! Then,
when it dies, there will be none.

Excellent attitude, you have just reinforced what the original poster
was saying.

your list is better, we get it, who would want to help you? you
obviously know everything.

BTW, the commodore community isn't all assholes. but there are a fair
share of them.

Retro is dead. The users that are left won't admit to it. By not
giving someone an honest reply and merely telling them to Google'It
they are killing their corner of the internet themeselves. You'll see,
Atari will be the last one standing.

Gee, I'm replying to a bunch of top-posters! Everybody who has replied to the thread has been a top poster!

Pointing someone to Google means simply "Get off your lazy arse and look for the info before flooding every damn Usenet group with a stupid question!"

Besides "Protean" has already asked this in the past. And I haven't seen ANY development on RTDOS in the 5 years or so PT has been spamming Usenet about it.

CF Flash card adapter, just this year.

>
> hmm, did you get an ehternet card?

No, just use a UDS-10

>
> IDE interface?

Yes, IDE interface last year (not counting the CF Flash which has an IDE
interface). This joins the SCSI interface that has been out for 10 years.

>
> Peripheral emulator?

And what is a "Peripheral emulator"?
We have Gram emulators that allow multiple cartridges to be loaded from
disk, modifications, etc.

>
> any cool demos? new games that push the limits of the hardware?

Yes, a few demos, a few games. But most of us are grown-ups and don't live
in our mommy's basements like yourself and your friends. And since I seem
to be arguing with such...

> no?
>
>
> hahahaha, we got all!

Here you go! *PLONK*

(Note to grown-ups reading this thread - I have the greatest respect of
other computer communities and have been a long-time lurker (and
participater) of Usenet groups such as comp.sys.apple2, .atari.8bit, .cbm,
.sinclair, .tandy, and .ti along with some programming groups as well)

uds-10 is ok if you cant make a real card.

a peripheral emulator is a program for your pc that connects to your
8bit (sio on atari or IEC on commodore) and allows the 8 bit to access
files on the pc as a native peripheral.

like APE for atari or CBM4WIN or 64hdd for commodore.

the point is, someone tried to help out the "community" which as far as
ti is concerned is dead, as noted by all the free ti stuff i see, the
lack of REAL expos or any demos or games that dont suck ass, and you
lash out.

YOU need to grow up and respond respectfully instead of saying GOOGLE
this, Snobs and arrogant asses say that, not members of a symbiotic
community.

as for the basement, i have been happily married for 13 years, out of
my parents house since i was 18, and very successful.

btw, commodore has had scsi since the 80s (atari too, if i am not
mistaken)

if your only semblance of comminuty is the lame yahoo group and some
website that has every lame ass plugin for nuke installed, you are as
good as dead.

I used to think other retro people were like us, but i find that they
are bitter because their communities are not thriving.

so feel free to talk down to a group that is clearly superior, we don't
mind getting our feet dirty once in a while :)

8076. Atari 5200 Digital joystick adapter

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-25 04:54:19 UTC
From: Rajni <krishnasoft@gmail.com>
Message-ID: <1167022459.719435.318280@i12g2000cwa.googlegroups.com>
Source record: 5433

Currently, auction is going on Atari 5200 digital joystick adapter at:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=320064613472&ssPageName=STRK:MESE:IT&ih=011

For details, you can see http://www.krishnasoft.com/sps.htm.

It's a special Y-type cable that hooks up to the DB15 joystick port of
an Atari 5200 and lets you use the Atari 2600 touchpad/keyboard
controller for most of your Atari 5200 keypad functions. The 2nd DB9
connector on the cable lets you control the X/Y/buttons of the Atari
5200 joystick using either PC software called MPDOS or via your own
constructed digital joystick.

Any questions, please ask. Thanks for your time.

MPDOS is also available in another auction at:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=320064614051&ssPageName=STRK:MESE:IT&ih=011

The pre-alpha version of Tic Tac Toe Plus, which is actually a Tic Tac Toe game, will be made available on Wed 27th.

Your contribution is needed and will be appreciated as we would like persons to sample this version of the game and give their honest comments, whether good or bad, report errors and problems, or give any good idea that will be splendid for the game.

This version is only a pre-alpha version, it is not a completed game, therefore do not expect mush visuals, options or gameplay as a matter of fact.

To test the pre-alpha version, subscribe to the group "Makers Of Video Games" at http://groups.google.com.vc/group/maker-of-video-games?hl=en. When your membership is permitted, which should not take any longer than 6 hours, you can then download and play the game.

Give all comments, reports, ideas and ask any question in the topic labelled "Comments on Tic Tac Toe Plus, Pre Alpha Version" at the group "Makers Of Video Games."

Please read the Page labelled "Tic Tac Toe Plus, Pre Alpha Version" in the group "Makers Of Video Games" before downloading and playing.

8081. Atari Flashback II and paddle controllers

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-27 00:21:04 UTC
From: borne@gate.net
Message-ID: <1167178864.186414.57520@i12g2000cwa.googlegroups.com>
Source record: 5438

Just got the AF2 and am using old paddle controllers for Warlords.
These paddle controllers have not been used in at least 15 years. They
seem to work ok, but the range of motion is limited. In other words,
the sheild travels in its complete motion with only a few degrees of
turn from the paddles. It makes it very difficult to control.

Is this a problem with the paddles, or the way the AF2 works with the
old paddles? Any help would be appreciated.

One additional question. Should I hack the AF2 to accept carts, or
should I just keep using my old Atari 2600 modified for RCA outputs?
I'd used the cartridge connector inside the 2600 for the AF2.

Thanks in advance.

8082. Looking for slightly more modern laser/inkjet printer success stories with Atari 850 or P:R: interface.

Newsgroup: comp.sys.atari.8bit

Source record: 5439

I am interested in connecting a slightly more modern parallel printer up to my atari with my 850 and/or P:R: interfaces.

Anybody here have any success with any more modern inkjets or laser printers? The one I am particularly interested in is the HP LaserJet 5L. They are cheap, and can be found by the thousands, but I can't find any information on whether or not they have an Epson FX/MX/RX emulation mode.

If the particular printer in question can't be used with the Atari, what could I use instead?

I am currently using an Epson MX-80 III dot matrix. Excellent printer, btw. My step-father bought it back in the day and was using it on a 8086 for YEARS, then gave it to me a couple of years ago when he cleared out his garage. So far, it is the only non-atari printer I have hooked up to my A8 and it worked right off the bat with no crazy hurdles to cross. It's just SLOW. :(

I appreciate any input.

Thanks,
David Bowden

Though I dont have an atari to test on, i would assume that any printer
with a parallel interface that runs in ibm dos mode would work with the
atari since all the logic / controls are on the printer, not in the
computer like the new printers.

I have a driver for AtariWriter for the HP Deskjet somewhere(I just
did a quick look and didn't find it)
This should work with most HP printers,as they used HPCL to controll
most of their printers.

As soon as I have time for a better search,I will send it to you.

Right now,I am using an Epson Stylus 800 (inkjet) with my Atari an it
works quite well!
Very reliable and the cartridge is easy to refill.

I am glad to see someone post something here,as it seems like this has
become an advertising venue for Ben Smith. :(

8089. The Atari Trackball

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-29 12:27:30 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <SQ7lh.27673$E02.11292@newsb.telia.net>
Source record: 5446

First of all I want to say thank you to everybody who replied to my questions in comp.sys.atari.8bit in the thread "Missile Command - home computer vs arcade" on Dec. 19, 2006, at 12:41.

Hearing about the possibility to connect a trackball (or an Atari ST mouse) to the 8-bit Atari computer enabling more authentic play of Missile Command, was inspiring.

Here is a technical question.

To my knowledge, the Atari 400/800/XL/XE computer series supports the following logical input on each 9-pin joystick port: Up, down, left, right, button 1, button 2, paddle 1, paddle 2. All are digital except the anolog paddle inputs. Some of the pins can be given output properties.

So how does the computer handle the input from a trackball or an ST mouse? The input from this type of device is a sequence of digital one bit events that need to be counted, either by the I/O hardware or by the CPU.

Anybody, please explain how the 8-bit Atari handles the trackball device.

Anders

I don't recall, but it would be interesting to just make a small program to print the values from the stick, paddle, and trigger registers in a contuous loop, and then connect a trackball and see what changes as you do so.

```
100 GRAPHICS 0
110 PRINT STICK(0)
120 PRINT STRIG(0)
130 PRINT STRIG(1)
140 PRINT PADDLE(0)
150 PRINT PADDLE(1)
160 GOTO 110
```

Unfortunately, I do not have any Atari trackball to try this
with. Maybe I have an ST mouse somewhere.

If the output from the trackball or mouse is a fast sequence
of bit values, then one could write a machine code program
that writes data from the joystick port to the frequency
register for an enabled sound channel and listen to it. The
BASIC program above would be too slow.

Two bit if I have it right. Just the raw bit data is decoded by the
processor in either the 2600 or 8 bit.
>
> Anybody, please explain how the 8-bit Atari handles the
> trackball device.

Rather then a pot they use quadrature encoding. I think one of the early
8 bit docs like De Re or Technical Ref had an explaination but Circuit
Cellar has a good explaination.

http://www.circuitcellar.com/library/designforum/trenches/1/index.asp

FWIW: The ST mouse is just an upside down trackball. Most serial ball
type MS/IBM mice used the same type scheme except they had ~PIC
microcontroller built into the mouse to decode the motion and do the
serial communication.

8093. Atari 1200XL Setup Problem

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-29 19:02:23 UTC

Hi there,

Can anyone help me? I got this really nice old PC at the flea market on
Sunday.
I cleaned it up and it says it is an Atari 1200XL. I don't really know
what that is.
It didn't have a VGA output but a TV cord was included. In one of the
disk drives
was a DOS disk, but it is version 2.0. It didn't work so I got out the
DOS Disk
for my old PC. My disk is version 6.22, but it doesn't work either.
I think it's the last one you can get on 5.25" disk. It is supposed to
work,
but it doesn't on my Atari.

I just get this nice colored Atari BIOS Logo. I am not able to get into
the
BIOS setup. I did a search on Google to see if I could find out how,
and I can't
find anything at all. Does anyone know which key I have to press?

Is there a way to hook up a CD-ROM drive and an NIC?

Thanks in advance,
Atarinoob

No, no NIC or CD-ROM.
You got more than one disk drive, so one of them
needs to be set for Drive 1 in order to boot.
You got the Atari logo screen so you have a monitor
setup/connection.
There's no BIOS to configure, the OS is fixed.
You must have a SIO cable from computer to drive.
You have a 9V AC power supply plugged into the
drive. If it is a 1050, you look at back and make
sure the black and white switches in the square hole
are to the left as you're looking inside, this sets the
drive as D1:
Luck

First of all it is NOT an intel powered machine. That DOS disk is for
AtariDOS 2.0 it is NOT intel/MS-DOS. Any software has to be Atari software.
I wish I had that very fine computer, I'd have it up and running in no time
and yes it does use the TV as a screen.

8097. Dead 600XL

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-30 01:47:23 UTC
From: Tristan Mumford <xtristan.xmumford@xgmail.xcom>

Source record: 5354

Hello!
I've posted here in the past asking about resurrecting a dead 600XL.
Something recently came to my attention.
What happens if the 'option' button is pressed during boot. I read it
bypasses BASIC, but that's all the info I could find. What does it display
etc?
I'm asking because I have some doubt about its side buttons. Well, all of it
to be honest.
I thought maybe it's just a case of overlooking something simple. Probably
not, but it's worth a shot.

Any help would be appreciated. Seeing one of my 8-bitters in a nonworking
state does make me sad.

Holding OPTION when you boot the 600XL will
give you the self-test screen, I think, if you have
no disk drive connected.
If you have nothing on the screen, it isn't the CONSOL
buttons problem (OPTION, SELECT, START, HELP).

Is your power supply OK?
Can you test it with another A8?

First off, I have no idea if the power supply is OK. Later today I should
have a chance to look at it. I'll start it up with the top off to check
voltages under load.
Unfortunately the only other things I have bearing the Atari logo are a Lynx
II (also dead) and a pile of 2600s, so a test on something else won't work.

> Holding OPTION when you boot the 600XL will
> give you the self-test screen, I think, if you have

Interesting. Thanks for that. Now I know what I'm not getting.
I have no floppy drives for it either.

> If you have nothing on the screen, it isn't the CONSOL
> buttons problem (OPTION, SELECT, START, HELP).

IIRC it just displays a brown screen. No sync problems etc. Like I said I'll
have a look a little later.

Is there anything simple I can type blind to get another reaction out of it,
ie a sound etc, to help narrow down the problem?

Thankyou for your help so far. Unfortunately I know very little about the
Atari 8 bit line, and need the help of more knowledgable individuals such
as yourself.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

Thanks for the answers!

I'll take a look, but there are no holes with switches in the back.
You say a 1050 drive? I was refering to the internal drives.

I'd like to continue on www.atariage.com, my account is just
beeing validated and i have posted a picture.

I'll update my post with the info i got here

thanks

Possibly a loose chip.

Open the machine and remove the silver coloured RF shield. The
keyboard plugs into the motherboard via a ribbon cable. Just be
careful not to damage it when pulling out and replacing.

Then just push gently on any socketed chips to ensure they're properly
seated.

> with SpartaDOS X and DOSXL. SuperDOS 5.1 cant detect Indus GT. how come?

I have 2 Indus GT drives sitting here, but I never used them other than to boot a few games and make sure they worked (1 is junk, the other is pristine). This is the first time I have heard of Synchromesh mode. Did a quick google and... holy crap. 72kbps? Anyways, if you follow this link http://www.faqs.org/faqs/atari-8-bit/faq/section-21.html you will see that the synchromesh mode is supported natively by SpartaDOS X and DOS XL.

Indeed, I did dig out my SDX cart and working Indus to check it. My Indus GT supports high speed mode, but does not support UltraSpeed mode, while my XF551 with the Hyper XF mod does, and so does AtariSIO/APE/SIO2PC. DOS XL is interesting, but it's obviously not as fast as SDX.

And regarding the XF551, it's high speed mode works with other DOSes than just SuperDOS 5.1. Examples include MyDOS if patched with Mathias' high speed driver (also works great on SIO2PC software), SDX, SD3.2G, and those are just the ones I know of.

The Indus GT is a fancy drive, but I think I prefer my XF. Having been inside both of these drives, I vastly prefer the XF's simplicity. On the inside, the Indus reminds me of a bowl of spaghetti.

The ID switch is on the back of the disk drive itself, not the computer and if you have more than one 1050 or 810 drive, then one of them has to be set for 1, and the other 2. No place for anything like a cd rom. I had a 12xl way back in the mid 80's wasn't a bad machine at all.

I'm very happy with the Kyocery Mita Laserprinters. They still support Epson and IBM ESC Codes (as well as PCL and Postscript), have all Codes documented in the handbooks (downloadable as PDF from the company webpage). Also the printers are very reliable and have low life cycle costs. Be sure to check the Emulation Features, as they also have some Windows only GDI Printer.

I have the FS1200D (with duplex printing feature).

My Indus can beat up your XF551! naya! naya! :)

Seriously though,I think the Indus is one tough drive.

I have six of them and all work like new,outside of having to clean the heads (because
of the build up of crud from 20 year old disks).

The XF551 is not so robust,I have four and two are down.One of the downers is powering
an IDE harddrive and the other one,I am going to try to mod into a 3.5",just for the h*ll of it.

Atari had a good idea,but tried to make them too cheaply (low quality).There has been a
lot of trouble with the SIO ports,among other things.

IMHO,the XF551 and the 360k format,now,are just not worth the trouble.To keep things
simple,I stick to the 180k format and flippies.

Like a lot of Atarians,I am in the process of recording my floppies (with SIO2PC/APE)
to disk images (that never deteriorate).

Even though our Atari disk drives have been troopers,the time is coming that they will
(sooner or later) fail.

Hello, Ed.
My website is gone. I have a 'briefcase' yahoo URL
where I can post stuff. You looking for something?
I changed ISPs several years ago.

Looks like I was slightly wrong about the symptom. The screen colour is red and not brown. I tried it in a different television.
There are also what appear to be 8 (possibly more off the left of the screen) vertical thin artefact style lines going from the extreme left to maybe 1/3 of the way across the screen. They even go past the top and bottom black borders.

Unfortunately there are no socketed ICs. All are soldered in.
I didn't get as far as checking the voltages. I did a far more primitive test.
After fiddling with the tuning on the TV I just went along and touched each chip to check the temperature.

U4 was warm. U11 and U12 were extremely hot. On realising this I killed the power.

Also, I'm not sure, but the ribbon cable conductors look discoloured in places like from heat.

Sorry about the self reply.
I just went through, cleaned up whatever traces I could etc. The board is in
poor shape underneath All the larger tracks are badly bubbled.
I now get a nice clear stable red screen with no artefacts. Nothing else
though. Oh well.

8116. Recording Atari game sequences

Newsgroup: comp.sys.atari.8bit
Date: 2006-12-31 11:06:27 UTC
From: Anders Skelander <ansk@hotmail.com>
Message-ID: <TQMlh.27847$E02.11400@newsb.telia.net>

I need advice on how to record game sequences running on an
Atari computer. I would like to record both graphics and
sound, preferrably on a PC with the Atari game running in an
emulator. It would be cool if the recordings could be
written to a DVD disc and played in any DVD player.

All this can probably be done if I connect "TV Out" from
the PC to a stand alone DVD recorder/player. I do not
have a stand alone DVD recorder/writer/player so I thought
maybe it would be possible to find a PC software based
solution to capture video and sound from the Atari emulator
and write to a file.

Thanks in advance for any help with this.

Anders

You could always try fraps. http://www.fraps.com/

I almost never use any Atari emulator, but I occasionally use Atari800 under
Linux, so I don't know if there's a win based Atari emulator that uses
DirectX or OpenGL. If there is an emu that uses either, fraps should be all
you need.

Good luck.

I suppose you could get yourself a video capture card and record from a real Atari! The nice ones have hardware encoders on the boards, but you can get a cheapy and use software encoders for $50 new, or even cheaper used!

In my nonspecialist opinion it sounds like the potentiometers in the
original paddles are a different value to the AF2 pots.

>
> One additional question. Should I hack the AF2 to accept carts, or

Personally I'd keep using the 2600. Especially because the paddles wouldn't
require modification.
Been meaning to do that RCA output mod to one of the 2600s around the
place... But first I have to find/fix a power supply. Through various
accidents most have had their cords broken.

Atari 800Win has a "Save Video" option.

It would really be great to have something like
http://www.c64-longplays.de.vu/ for the A8!

Happy new year to all Atarians,

Frank

Probably RAM. If you get as far as a stable screen of some kind that
usually means GTIA, 6502, et cetera, are all working through the initial
start up.

But leave it on over night and reboot in the morning. This sometimes helps.

Hi,

I remember years ago typing pages and pages of basic code into my 800xl, the code mostly came from ANTIC magazine. I've found ANTIC magazine online with all of the programs. But they did not include any of the source code. Can anybody tell me where I can find the source code from the magazines? Unfortunately I no longer have the magazines. :-(

Thanks.

OK, thanks for your help!

> It would really be great to have something like
> http://www.c64-longplays.de.vu/ for the A8!

This is off topic from an Atari point of view, but anyway: I
tried to play the Snokie file on my Windows XP PC, but the
basic version of Real Player 10.5 tells me to update with
an additional software module. I accept this action and then
it tells me the module cannot be found...

How about downloading the new 4.39 Version from
http://trub.atari8.info/index.php3?strona=html/sdx_upgrade_en.html

You can also find the original DOS XL Indus Disks with the Synchromesh
Driver and a more information about the Indus at
http://www.retrobits.net/atari/indus.shtml

Happy New Year!

Carsten
